CS150 - Final "Cheat Sheet"

1 Input/Output

- Reading input from the user raw_input(message): Displays *message* to the user and return what the user typed as a string
- Reading from a file

```
file = open(filename, "r")
for line in file:
    # do something
```

file.close()

- Writing to a file
 - Opening a file for writing:

file = open(filename, "w") # begin writing from the beginning
or
file = open(filename, "a") # append to the end of the existing contents

- the write method writes strings and other objects to the opened file (without and carriage return)
- Reading from URLs (e.g. web pages)

```
import urllib
web_page = urllib.urlopen(some_url)
```

```
for line in web_page:
    # do something
```

• Command-line arguments

import sys

sys.argv is a list containing the command-line arguments.

2 Strings

- The following functions are built-in and answer questions about strings
 - len(string): Returns the number of characters in the string
 - int(string) float(string): Converts a string to an int or float
- String object methods
 - upper() lower(): Returns a new string that is upper or lower cased
 - find(some_string): Returns the index that some_string occurs at in the string or -1 if it does not occur.
 - find(some_string, index): Same as above, but starts searching at index
 - replace(old, new): Return a copy of the string with all occurrences of *old* substituted with *new*
 - startswith(prefix): Returns True if the string starts with *prefix*, False otherwise
 - endswith(prefix): Returns True if the string ends with *prefix*, False otherwise
 - strip(): Returns a copy of the string with leading and trailing whitespace removed
 - split(): Return a list of the words in the string using a space as the delimiter
- String operators
 - string1 + string2: Returns a new string that is the concatenation of string1 and string2
 - string * int: Returns a new string that is string repeated int times

3 Lists

- Creating new lists
 - [] creates an empty list
 - [object1, object2, object3, ...] Creates a list containing the objects
- The following functions are built-in and answer questions about lists
 - len(list): Returns the number of entries in the list

- List object methods
 - append(x): Adds x to the end of the list
 - extend(other_list): Adds all of the elements in other_list to the end of the list
 - find(item): Return the index of the first occurrence of item in the list, -1 if item does not occur in the list
 - insert(index, x): Insert x at *index* in the list
 - pop(): Removes the item at the end of the list and returns it
 - pop(index): Removes item at *index* from the list and returns it
 - reverse(): Reverses the elements in the list
 - sort(): sorts the elements in the list
- List operators
 - list1 + list2: Returns a new list that contains the elements of list1 followed by the elements of list2
 - list * int: Returns a new list that contains the items in *list* repeated *int* times
 - item in list Returns True if item is in list, False otherwise

4 Sets

- Creating new sets
 - set() creates an empty set
 - set(iterable) can also be called with any iterable object (e.g. strings or lists) and it will create a new set with each item in that iterable object
- The following functions are built-in and answer questions about sets
 - len(set): Returns the number of entries in the set
- Set object methods
 - add(...): Add an element to the set
 - clear(): Remove all elements from the set
 - difference(...): Returns the difference of two sets
 - intersection(...): Returns the intersection of two sets
 - pop(): Remove an arbitrary element from the set
 - remove(item): Removes the item from the set
 - union(...): Returns the union of two sets
- Set operators
 - item in set Returns True if item is in set, False otherwise

5 Dictionaries

- Creating dictionaries
 - {} creates a new empty dictionary
 - {key1:value1, key2:value2, ...} creates a new dictionary with key value pairs
- The following functions are built-in and answer questions about dictionaries
 - len(dict): Returns the number of entries (key/value pairs) in the dictionary
- Dictionary object methods
 - clear: Remove all of the items in the dictionary
 - items: Returns a list of key/value tuples of the key/value pairs in the dictionary
 - keys: Returns a list of the keys in the dictionary
 - values: Returns a list of the values in the dictionary
- Dictionary operators
 - item in dict Returns True if item is in the keys of dict, False otherwise

6 Tuples

- Creating new tuples
 - () creates an empty tuple
 - (object1, object2, object3, ...) Creates a list containing the objects
- The following functions are built-in and answer questions about lists
 - len(tuple): Returns the number of entries in the tuple
- Tuple operators
 - tuple1 + tuple2: Returns a new tulple that contains the elements of tuple1 followed by the elements of tuple2
 - item in tuple Returns True if item is in tuple, False otherwise

7 Modules

- turtle module
 - forward(distance): Move the turtle forward by the specified distance
 - right(angle) left(angle): Turn the turtle right/left by angle
 - goto(x, y): Move turtle to position x, y
 - setheading(angle): Set the turtles heading to angle
 - circle(radius): Draw a circule with radius radius
 - penup(): Pull the pen up no drawing when moving
 - pendown(): Put the pen down drawing when moving
 - fillcolor(color): Change the fill color to *color*, where *color* is a string
 - begin_fill(): Start filling
 - end_fill(): Fill in the shape drawn since the last call to begin_fill
- random module
 - randint(a, b): Return a random integer N such that $a \leq N \leq b$
 - uniform(a, b): Return a random floating point number N such that $a \leq N \leq b$
- math module
 - sqrt(num): Return the square root of num
- matplotlib module

Importing: from matplotlib import pyplot

- pyplot.plot(x, y): add data in lists x and y to the plot
- pyplot.show(): display the graph
- pyplot.xlabel(string): label the x-axis with string (similarly pyplot.ylabel
- pyplot.title(string): set string as the title of the plot
