Neural Networks

Joseph C. Osborn

CS51A

Spring 2020

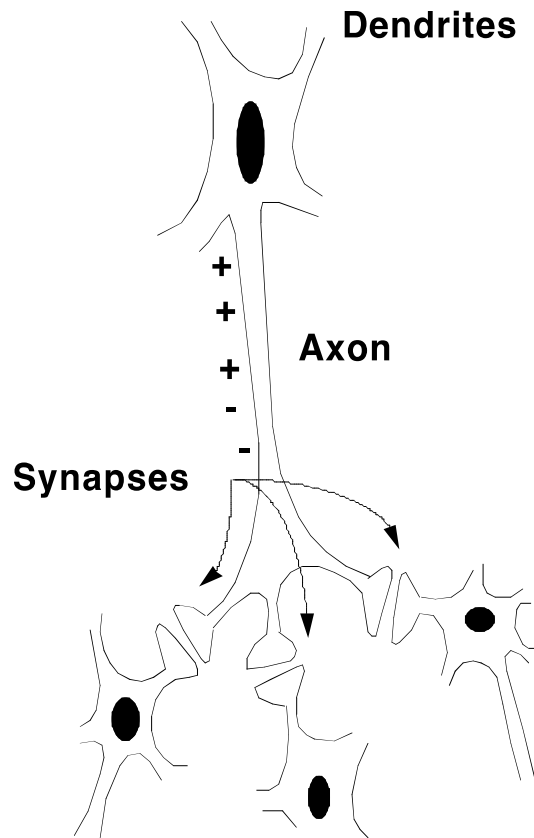

Neural Networks

Neural Networks try to mimic the structure and function of our nervous system

People like biologically motivated approaches

Our Nervous System

Neuron

What do you know?

Our nervous system: the computer science view

the human brain is a large collection of interconnected neurons

a **NEURON** is a brain cell

- they collect, process, and disseminate electrical signals
- they are connected via synapses
- they **FIRE** depending on the conditions of the neighboring neurons

Our nervous system

The human brain

- contains $\sim 10^{11}$ (100 billion) neurons
- each neuron is connected to $\sim 10^4$ (10,000) other neurons
- Neurons can fire as fast as 10^{-3} seconds

How does this compare to a computer?

Man vs. Machine

10^{11} neurons
 10^{11} neurons
 10^{14} synapses
 10^{-3} "cycle" time

10^{10} transistors
 10^{11} bits of ram/memory
 10^{13} bits on disk
 10^{-9} cycle time

Brains are still pretty fast

Who is this?

Brains are still pretty fast

If you follow basketball, you'd be able to identify this person in under a second!

Given a neuron firing time of 10^{-3} s, **how many neurons in sequence could fire in this time?**

- A few hundred, maybe a thousand

What are possible explanations?

- either neurons are performing some very complicated computations
- brain is taking advantage of the **massive** parallelization (remember, neurons are connected $\sim 10,000$ other neurons)

Artificial Neural Networks

our approximation

W is the strength of signal sent between A and B.

If A fires and w is **positive**, then A **stimulates** B.

If A *fires* and w is **negative**, then A **inhibits** B.

A given neuron has many, many connecting, input neurons

If a neuron is stimulated enough, then it also fires

How much stimulation is required is determined by its **threshold**

A Single Neuron/Perceptron

Possible threshold functions

hard threshold

$$g(x) = \begin{cases} 1 & \text{if } x \geq \text{threshold} \\ 0 & \text{otherwise} \end{cases}$$

sigmoid

$$g(x) = \frac{1}{1 + e^{-ax}}$$

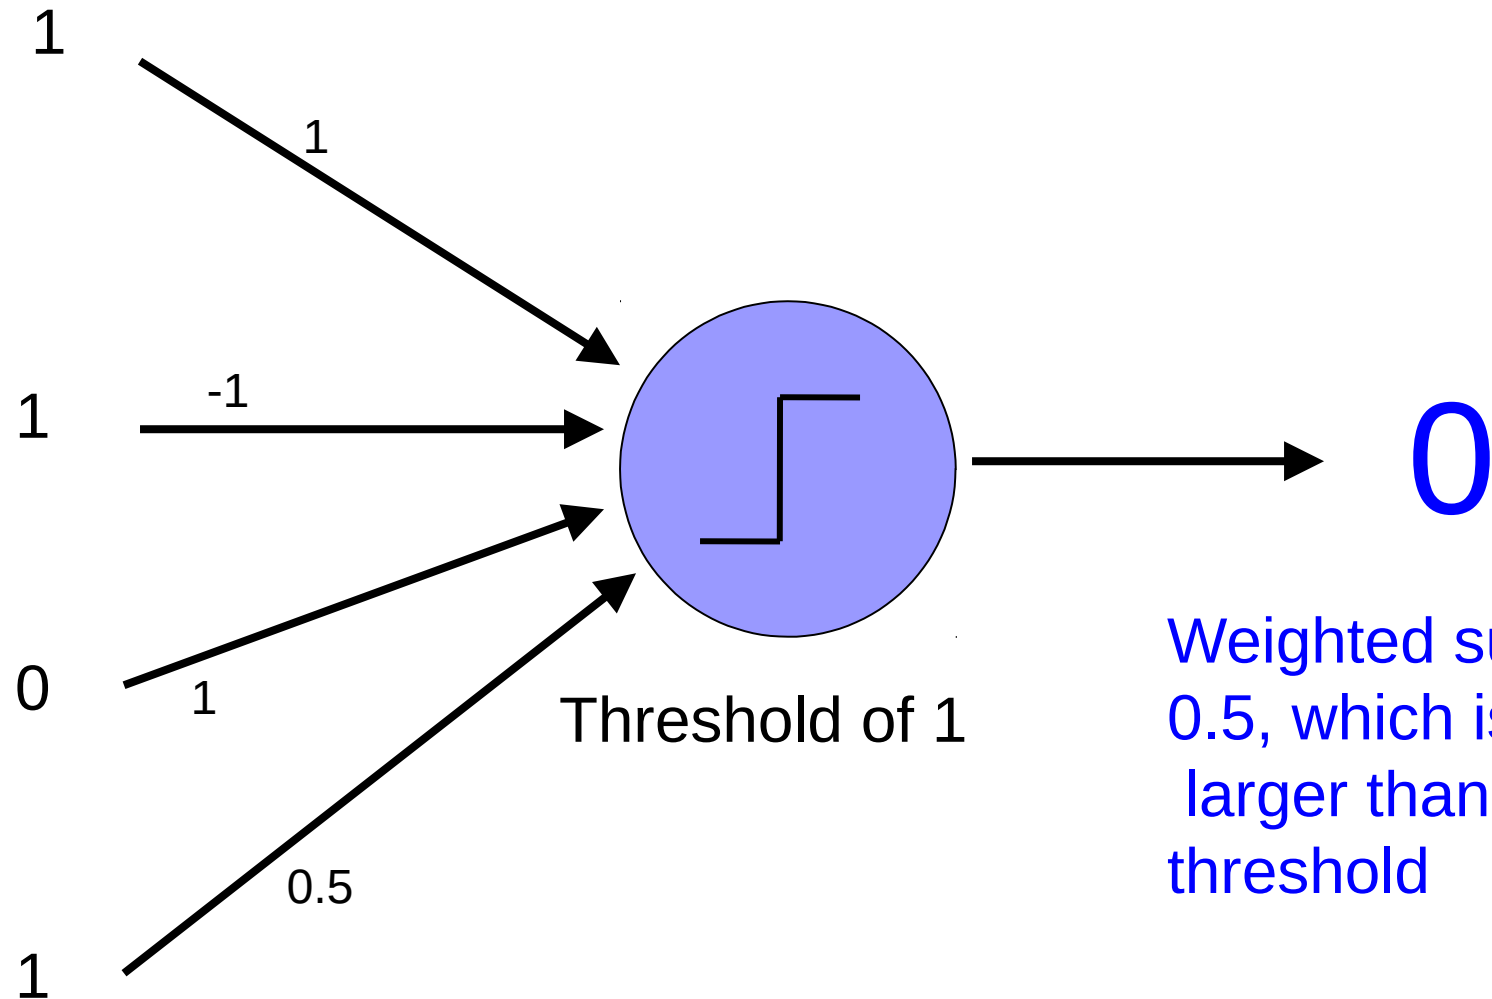

A Single Neuron/Perceptron

A Single Neuron/Perceptron

A Single Neuron/Perceptron

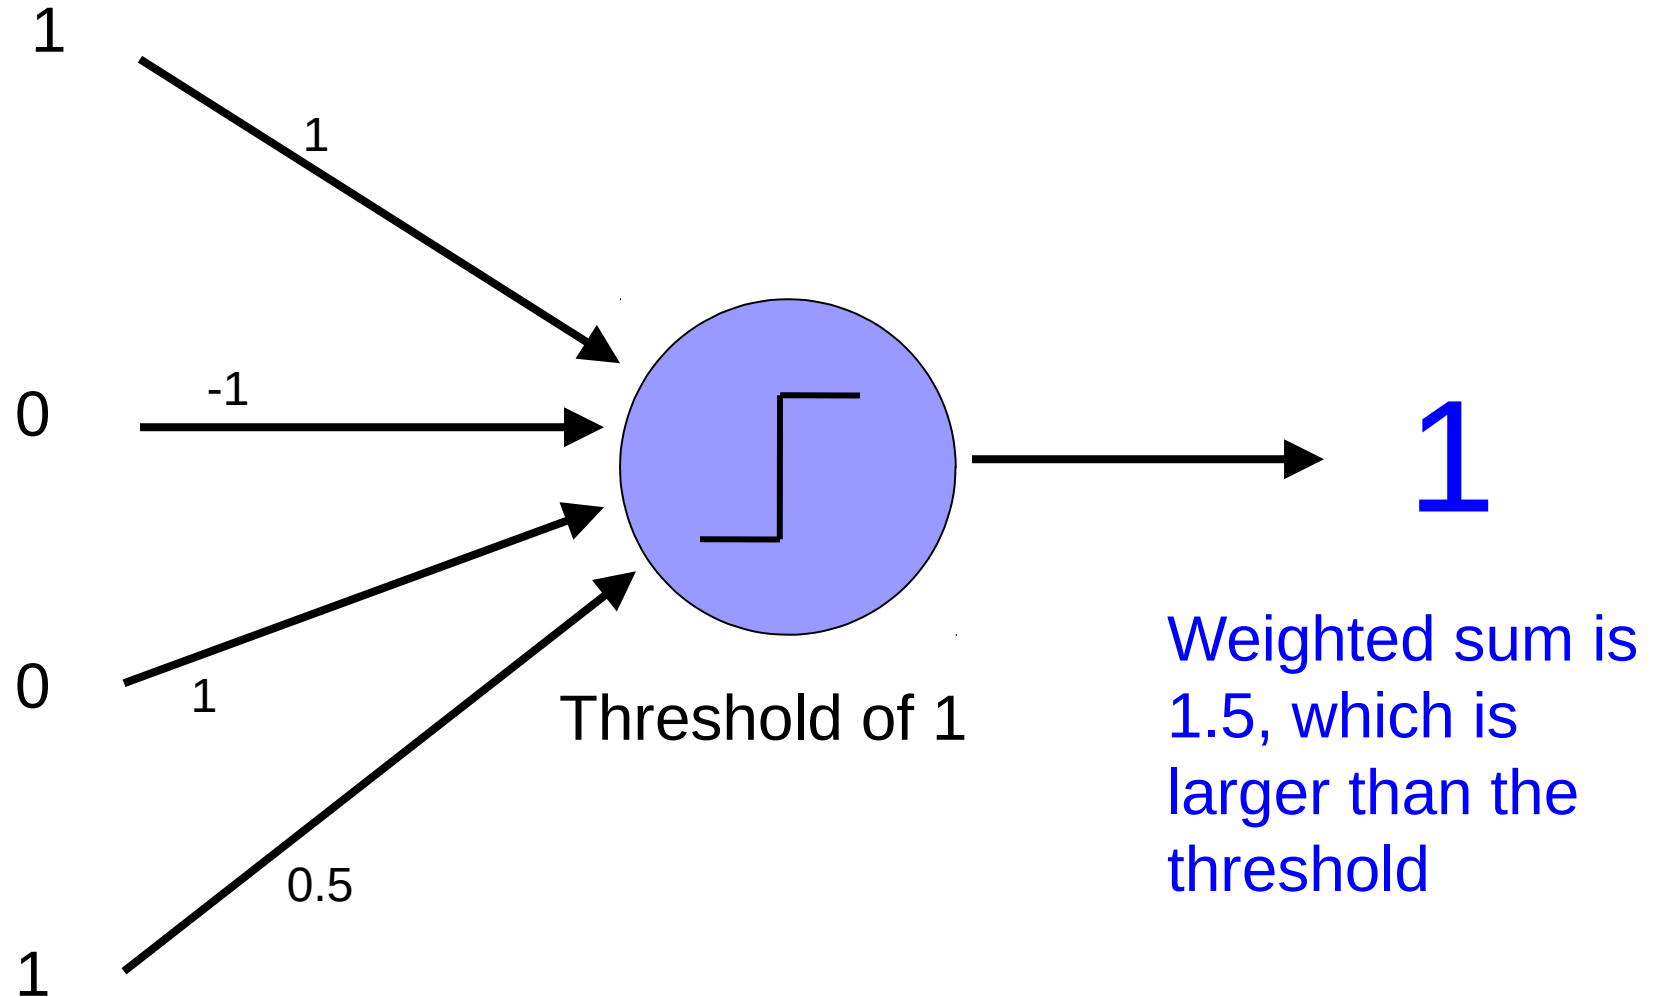

A Single Neuron/Perceptron

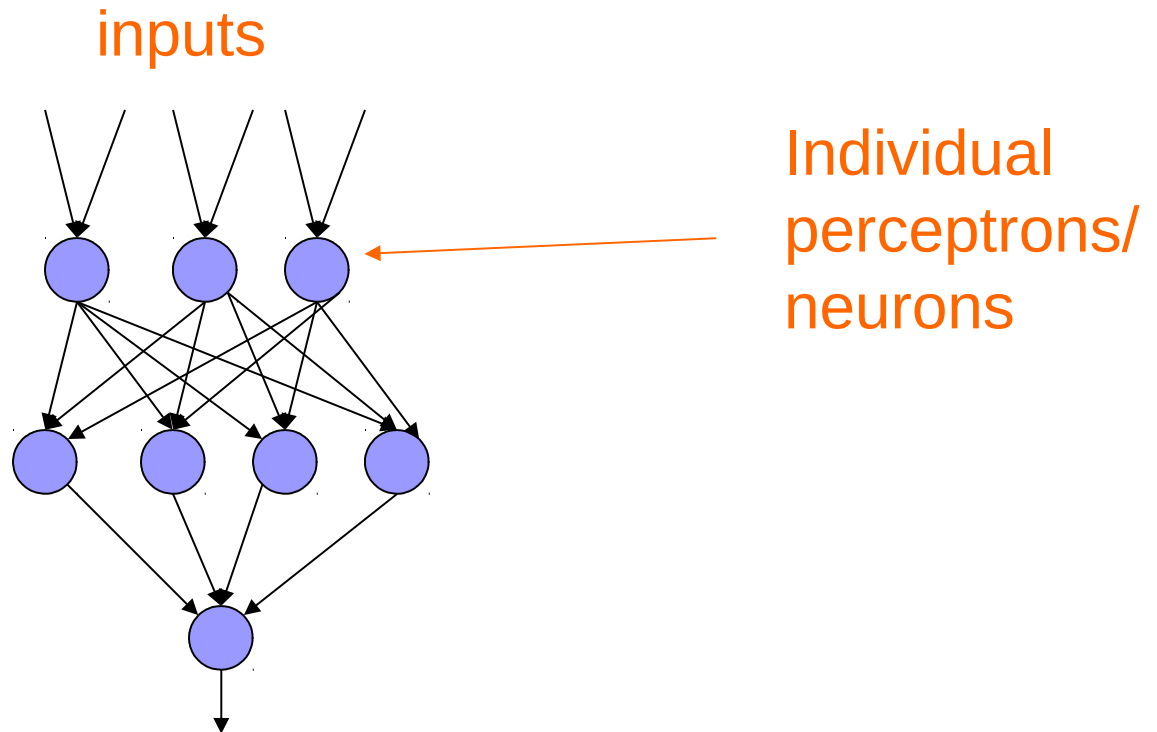

$$1*1 + 0*-1 + 0*1 + 1*0.5 = 1.5$$

A Single Neuron/Perceptron

Neural network

Neural network

some inputs are
provided/entered

Neural network

inputs

each perceptron
computes and
calculates an answer

Neural network

those answers
become inputs for
the next level

Neural network

finally get the answer
after all levels compute

Neural networks

Different kinds/characteristics of networks

How are these different?

Neural networks

Feed forward networks

Neural networks

inputs

Recurrent network

Output is fed back to input

Can support memory!

How?

History of Neural Networks

McCulloch and Pitts (1943) – introduced model of artificial neurons and suggested they could learn

Hebb (1949) – Simple updating rule for learning

Rosenblatt (1962) - the *perceptron* model

Minsky and Papert (1969) – wrote *Perceptrons*

Bryson and Ho (1969, but largely ignored until 1980s--Rosenblatt) – invented back-propagation learning for multilayer networks

inputs

hidden units/layer

Training the perceptron

First wave in neural networks in the 1960's

Single neuron

Trainable: its threshold and input weights can be modified

If the neuron doesn't give the desired output, then it has made a mistake

Input weights and threshold can be changed according to a learning algorithm

Examples - Logical operators

AND – if all inputs are 1, return 1, otherwise return 0

OR – if at least one input is 1, return 1, otherwise return 0

NOT – return the opposite of the input

XOR – if exactly one input is 1, then return 1, otherwise return 0

AND

x_1	x_2	x_1 and x_2
0	0	0
0	1	0
1	0	0
1	1	1

AND

x_1	x_2	x_1 and x_2
0	0	0
0	1	0
1	0	0
1	1	1

AND

x_1	x_2	x_1 and x_2
0	0	0
0	1	0
1	0	0
1	1	1

Inputs are either 0 or 1

AND

AND

Inputs are either 0 or 1

OR

x_1	x_2	x_1 or x_2
0	0	0
0	1	1
1	0	1
1	1	1

OR

x_1	x_2	x_1 or x_2
0	0	0
0	1	1
1	0	1
1	1	1

OR

x_1	x_2	x_1 or x_2
0	0	0
0	1	1
1	0	1
1	1	1

Inputs are either 0 or 1

OR

OR

Output is 1 if at least 1 input is 1

Inputs are either 0 or 1

NOT

x_1	not x_1
0	1
1	0

NOT

x_1	not x_1
0	1
1	0

NOT

How about...

x_1	x_2	x_3	$x_1 \text{ op } x_2$
0	0	0	1
0	1	0	0
1	0	0	1
1	1	0	0
0	0	1	1
0	1	1	1
1	0	1	1
1	1	1	0

Training neural networks

Learn the individual weights between nodes

Learn individual node parameters (e.g. threshold)

Positive or negative?

NEGATIVE

Positive or negative?

NEGATIVE

Positive or negative?

POSITIVE

Positive or negative?

NEGATIVE

Positive or negative?

POSITIVE

Positive or negative?

POSITIVE

Positive or negative?

NEGATIVE

Positive or negative?

POSITIVE

A method to the madness

blue = positive

yellow triangles = positive

all others negative

How did you figure this out (or some of it)?

Training neural networks

x_1	x_2	x_3	x_1 and x_2
0	0	0	1
0	1	0	0
1	0	0	1
1	1	0	0
0	0	1	1
0	1	1	1
1	0	1	1
1	1	1	0

1. start with some initial weights and thresholds
2. show examples repeatedly to NN
3. update weights/thresholds by comparing NN output to actual output
