Foxes and Chickens

Three foxes and three chickens wish to cross the river. They have a small boat that will carry up to two animals. Everyone can navigate the boat. If at any time the foxes outnumber the chickens on either bank of the river, they will eat the chickens. Find the smallest number of crossings that will allow everyone to cross the river safely.

10

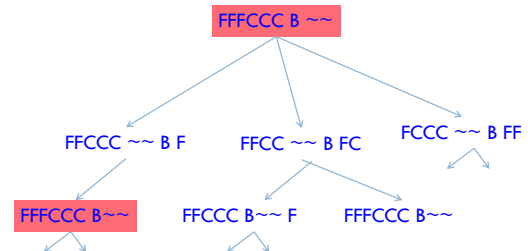

One other problem

What would happen if we ran DFS here?

11

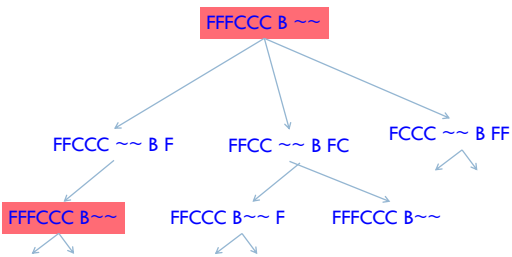

One other problem

If we always go left first, will continue forever!

12

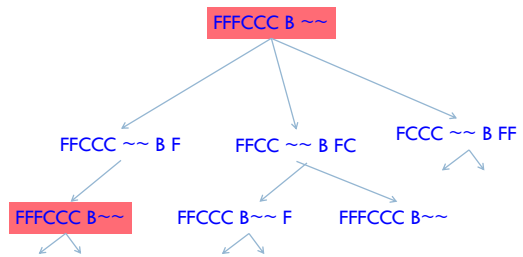

One other problem

Does BFS have this problem?

13

One other problem

Does BFS have this problem? No!

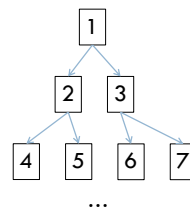

14

DFS vs. BFS

Why do we use DFS then, and not BFS?

15

DFS vs. BFS

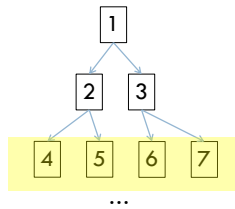

Consider a search problem where each state has two states you can reach

Assume the goal state involves 20 actions, i.e. moving between ~20 states

How big can the queue get for BFS?

16

DFS vs. BFS

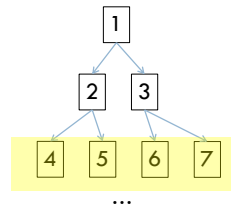

Consider a search problem where each state has two states you can reach

Assume the goal state involves 20 actions, i.e. moving between ~20 states

At any point, need to remember roughly a "row"

17

DFS vs. BFS

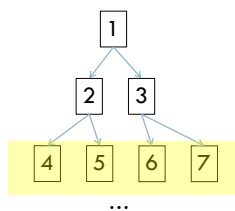

Consider a search problem where each state has two states you can reach

Assume the goal state involves 20 actions, i.e. moving between ~20 states

How big does this get?

18

DFS vs. BFS

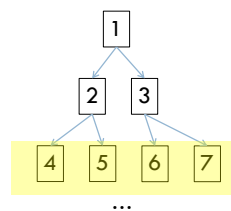

Consider a search problem where each state has two states you can reach

Assume the goal state involves 20 actions, i.e. moving between ~20 states

Doubles every level we have to go deeper.
For 20 actions that is $2^{20} \approx 1$ million states!

19

DFS vs. BFS

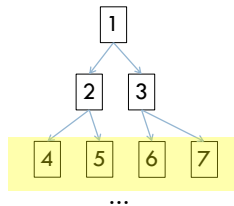

Consider a search problem where each state has two states you can reach

Assume the goal state involves 20 actions, i.e. moving between ~20 states

How many states would DFS keep on the stack?

20

DFS vs. BFS

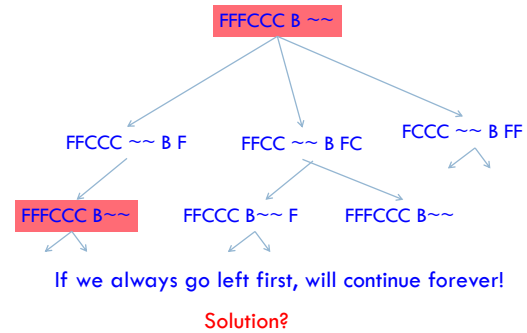

Consider a search problem where each state has two states you can reach

Assume the goal state involves 20 actions, i.e. moving between ~20 states

Only one path through the tree, roughly 20 states (really 20×2)

21

One other problem

22

DFS avoiding repeats

```
def dfs(state, visited):
    # note that we've visited this state
    visited[str(state)] = True

    if state.is_goal():
        return [state]
    else:
        result = []
        for s in state.next_states():
            # check if we've visited a state already
            if not(str(s) in visited):
                result += dfs(s, visited)
        return result
```

23

Other search problems

What problems have you seen that could be posed as search problems?

What is the state?

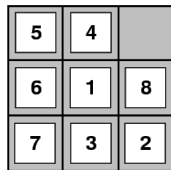

Start state

Goal state

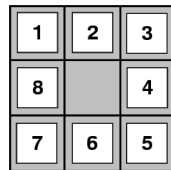

State-space/transition between states

24

Start State

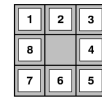

Goal State

25

8-puzzle

goal

Goal State

state representation?

start state?

state-space/transitions?

26

8-puzzle

state:

- all 3 x 3 configurations of the tiles on the board

transitions between states:

- Move Blank Square Left, Right, Up or Down.
- This is a more efficient encoding than moving each of the 8 distinct tiles

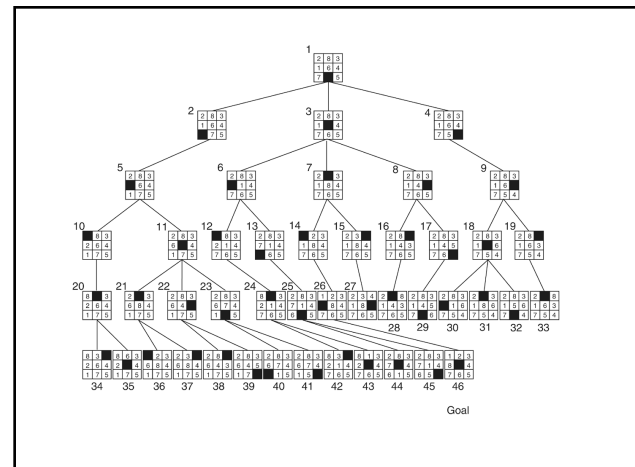

Start State

Goal State

27

28

Cryptarithmic

Find an assignment of digits (0, ..., 9) to letters so that a given arithmetic expression is true.
examples:

$$\text{SEND} + \text{MORE} = \text{MONEY}$$

```

FORTY
+ TEN
+ TEN
-----
SIXTY
F=2, O=9, R=7, etc.

```

29

Remove 5 Sticks

Given the following configuration of sticks, remove exactly 5 sticks in such a way that the remaining configuration forms exactly 3 squares.

30

Water Jug Problem

Given a full 5-gallon jug and a full 2-gallon jug, fill the 2-gallon jug with exactly one gallon of water.

31

Water Jug Problem

State = (x,y) , where x is the number of gallons of water in the 5-gallon jug and y is # of gallons in the 2-gallon jug

Initial State = $(5,2)$

Goal State = $(*,1)$, where * means any amount

Operator table

Name	Cond.	Transition	Effect
Empty5	—	$(x,y) \rightarrow (0,y)$	Empty 5-gal. jug
Empty2	—	$(x,y) \rightarrow (x,0)$	Empty 2-gal. jug
2to5	$x \leq 3$	$(x,2) \rightarrow (x+2,0)$	Pour 2-gal. into 5-gal.
5to2	$x \geq 2$	$(x,0) \rightarrow (x-2,2)$	Pour 5-gal. into 2-gal.
5to2part	$y < 2$	$(1,y) \rightarrow (0,y+1)$	Pour partial 5-gal. into 2-gal.

32

8-puzzle revisited

How hard is this problem?

1	3	8
4		7
6	5	2

33

8-puzzle revisited

The average depth of a solution for an 8-puzzle is 22 moves

An exhaustive search requires searching $\sim 3^{22} = 3.1 \times 10^{10}$ states

- BFS: 10 terabytes of memory
- DFS: 8 hours (assuming one million nodes/second)

Can we do better?

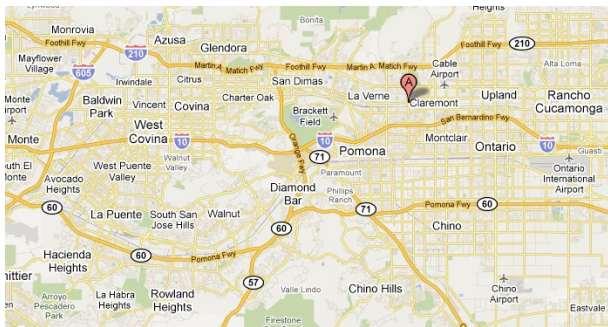

Are DFS and BFS intelligent?

1	3	8
4		7
6	5	2

Ideas?

39

from: Claremont to: Rowland Heights

We'd like to bias search towards the actual solution

40

Informed search

Order to_visit based on some knowledge of the world that estimates how “good” a state is

- ▣ $h(n)$ is called an evaluation function

Best-first search

- ▣ rank to_visit based on $h(n)$
- ▣ take the most desirable state in to_visit first
- ▣ different approaches depending on how we define $h(n)$

41

Heuristic

Merriam-Webster's Online Dictionary

Heuristic (pron. \hyu- 'ris-tik\): adj. [from Greek *heuriskein* to discover.] involving or serving as an aid to learning, discovery, or problem-solving by experimental and especially trial-and-error methods

The Free On-line Dictionary of Computing (2/19/13)

heuristic 1. Of or relating to a usually speculative formulation serving as a guide in the investigation or solution of a problem: "The historian discovers the past by the judicious use of such a heuristic device as the 'ideal type'" (Karl J. Weintraub).

42

Heuristic function: $h(n)$

An estimate of how close the node is to a goal

Uses domain-specific knowledge!

Examples

- ▣ **Map path finding?**
 - ▣ straight-line distance from the node to the goal ("as the crow flies")
- ▣ **8-puzzle?**
 - ▣ how many tiles are out of place
 - ▣ sum of the "distances" of the out of place tiles
- ▣ **Foxes and Chickens?**
 - ▣ number of animals on the final bank

Best first search: out of place tiles?

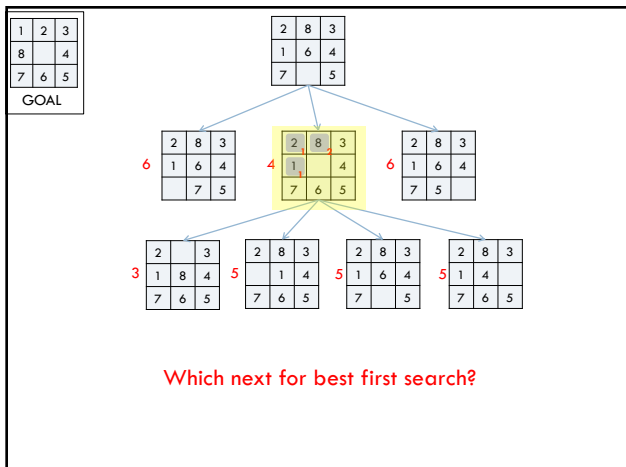

56

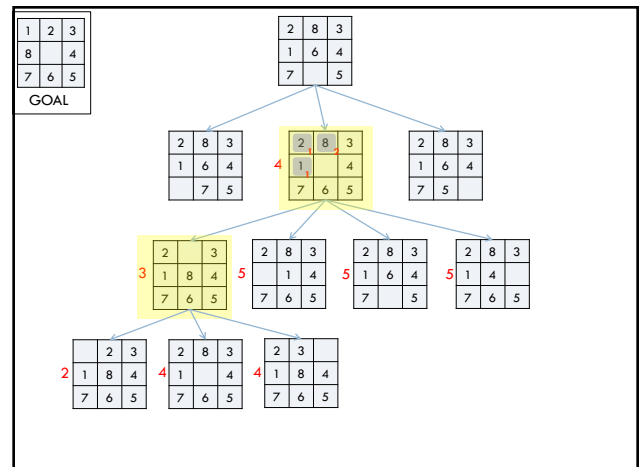

57

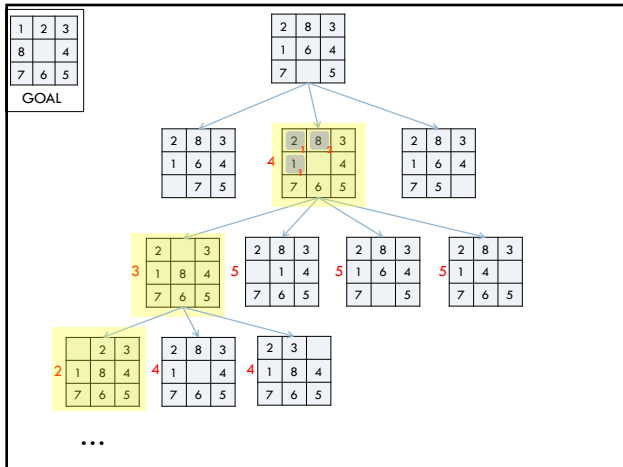

58

59

60

61

Informed search algorithms

Best first search is called an “informed” search algorithm

Why wouldn't we always use an informed algorithm?

- Coming up with good heuristics can be hard for some problems
- There is computational overhead (both in calculating the heuristic and in keeping track of the next “best” state)

62

Informed search algorithms

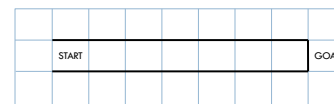

Any other problems/concerns about best first search?

63

Informed search algorithms

Any other problems/concerns about best first search?

- Only as good as the heuristic function

Best first search using straight line distance as heuristic

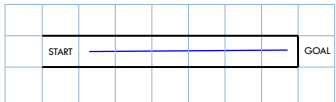

What would the search do?

64

Informed search algorithms

Any other problems/concerns about best first search?

- Only as good as the heuristic function

Best first search using straight line distance as heuristic

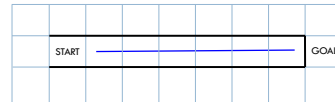

What is the problem?

65

Informed search algorithms

Any other problems/concerns about best first search?

- Only as good as the heuristic function

Best first search using straight line distance as heuristic

Doesn't take into account how far it has come.
Best first search is a "greedy" algorithm

66

Informed search algorithms

Best first search is called an "informed" search algorithm

There are many other informed search algorithms:

- A* search (and variants)
- Theta*
- Beam search

	5						4	
		6			7			
			5		1			
				8				

Generate next states:

- pick an open entry
- try all possible numbers that meet constraints

Now what?

Try another branch, i.e. go back to a place where we had a decision and try a different one

Fill in the grid with the numbers 1-9

- each row has 1-9 (without repetition)
- each column has 1-9 (without repetition)
- each quadrant has 1-9 (without repetition)

84

Sudoku

1	2	8						
	4	3				6	7	
5			4		2			8
8				6				1
2								5
	5						4	
		6				7		
			5		1			
				8				

Generate next states:

- pick an open entry
- try all possible numbers that meet constraints

7, 8, 9

Fill in the grid with the numbers 1-9

- each row has 1-9 (without repetition)
- each column has 1-9 (without repetition)
- each quadrant has 1-9 (without repetition)

85

Best first Sudoku search

DFS and BFS will choose entries (and numbers within those entries) randomly

Is that how people do it?

How do you do it?

Heuristics for best first search?

Generate next states:

- pick an open entry
- try all possible numbers that meet constraints

86

Best first Sudoku search

DFS and BFS will choose entries (and numbers within those entries) randomly

Pick the entry that is **MOST** constrained

People often try and find entries where only one option exists and only fill it in that way (very little search)

Generate next states:

- pick an open entry
- try all possible numbers that meet constraints

87

Representing the Sudoku board

	4	3				6	7	
5			4		2			8
8				6				1
2								5
	5						4	
		6				7		
			5		1			
				8				

[1, 6, 7, 9], [1, 2, 6, 7, 8, 9], [1, 2, 7, 8, 9],
[1, 9], 4, 3,
5, [1, 6, 7, 9], [1, 7, 9]

Which is the most constrained (of the ones above)?

□ Board is a matrix (list of lists)

□ Each entry is either:

- a number (if we've filled in the space already, either during search or as part of the starting state)
- a list of numbers that are valid to put in that entry if it hasn't been filled in yet

88

5			4	2			8
8				6			1
2							5
	5					4	
		6			7		
			5	1			
				8			

What would the state look like if we add pick 1?

- Board is a matrix (list of lists)
- Each entry is either:
 - a number (if we've filled in the space already, either during search or as part of the starting state)
 - a list of numbers that are valid to put in that entry if it hasn't been filled in yet

90

Representing the Sudoku board

1	4	3			6	7	
5			4	2			8
8				6			1
2							5
	5					4	
		6			7		
			5	1			
				8			

[6, 7, 9], [2, 6, 7, 8, 9], [2, 7, 8, 9],
 1, 4, 3,
 5, [6, 7, 9], [7, 9]

Remove 1 from all entries in the quadrant

What other parts of the board need to be updated?

- Board is a matrix (list of lists)
- Each entry is either:
 - a number (if we've filled in the space already, either during search or as part of the starting state)
 - a list of numbers that are valid to put in that entry if it hasn't been filled in yet
