

Assume the first user input is "hello" and the second user input is "47". Draw the state of the stack immediately ~~when~~ ^{before} line 9 (the return statement in get_pos_int) gets executed.

```
def is_pos_int(s):  
    1 if str.isdigit(s):  
    2     return int(s) > 0  
    3 else:  
    4     return False  
def get_pos_int():  
    5 done = False  
    6 while not done:  
    7     s = input()  
    8     done = is_pos_int(s)  
    9 return s  
def main():  
    10 get_pos_int()  
  
main()
```
