## Parsing evaluation

- You've constructed a parser
- You want to know how good it is
- Ideas?

### Parsing evaluation

The diagram shows a horizontal bar representing a Treebank. The bar is divided into three segments: a large blue segment labeled 'Train', a smaller light blue segment labeled 'Dev', and a small red segment labeled 'Test'.

- Learn a model using the training set
- Parse the test set without looking at the “correct” trees
- Compare our generated parse tree to the “correct” tree

### Comparing trees

**Computed Tree P**

**Correct Tree T**

Ideas?

### Comparing trees

- Idea 1: see if the trees match exactly
  - Problems?
    - Will have a low number of matches (people often disagree)
    - Doesn't take into account getting it *almost* right
- Idea 2: compare the constituents

### Comparing trees

**Computed Tree P**

**Correct Tree T**

How many constituents match?  
How can we turn this into a score?

### Evaluation measures

- Precision
 
$$\frac{\# \text{ of correct constituents}}{\# \text{ of constituents in the computed tree}}$$
- Recall
 
$$\frac{\# \text{ of correct constituents}}{\# \text{ of constituents in the correct tree}}$$
- F1
 
$$\frac{2 * \text{Precision} * \text{Recall}}{\text{Precision} + \text{Recall}}$$

### Comparing trees

**Computed Tree P**

# Constituents: 11  
# Correct Constituents: 9

Precision: 9/11

**Correct Tree T**

# Constituents: 10

Recall: 9/10

F1: 0.857

### Parsing evaluation

- Corpus: Penn Treebank, WSJ

Training: sections 02-21  
 Development: section 22 (here, first 20 files)  
 Test: section 23

- Parsing has been fairly standardized to allow for easy comparison between systems

### Treebank PCFGs

- Use PCFGs for broad coverage parsing
- Can take a grammar right off the trees (doesn't work well):

$ROOT \rightarrow S$   
 $S \rightarrow NP VP$   
 $NP \rightarrow PRP$   
 $VP \rightarrow VBD ADJP$   
 .....

Model	F1
Baseline	72.0

## Generic PCFG Limitations

- PCFGs do not use any information about where the current constituent is in the tree
- PCFGs do not rely on specific words or concepts, only general structural disambiguation is possible (e.g. prefer to attach PPs to Nominals)
- MLE estimates are not always the best

## Conditional Independence?

- Not every NP expansion can fill every NP slot
  - A grammar with symbols like "NP" won't be context-free
  - Statistically, conditional independence too strong

## Non-Independence

- Independence assumptions are often too strong

- Example: the expansion of an NP is highly dependent on the parent of the NP (i.e., subjects vs. objects).
- Also: the subject and object expansions are correlated

## Grammar Refinement

- PCFG would treat these two NPs the same... but they're not!
- We can't exchange them: "the noise heard she"
- Idea: expand/refine our grammar
- Challenges:
  - Must refine in ways that facilitate disambiguation
  - Must trade-offs between too little and too much refinement. **Concerns?**
    - Too much refinement -> sparsity problems
    - To little -> can't discriminate (PCFG)

### Grammar Refinement

```

graph TD
    S --> NP1[NP]
    S --> VP[VP]
    NP1 --> PRP[PRP]
    PRP --> She[She]
    VP --> VBD[VBD]
    VBD --> heard[heard]
    VP --> NP2[NP]
    NP2 --> DT[DT]
    DT --> the[the]
    NP2 --> NN[NN]
    NN --> noise[noise]
    
```

Ideas?

### Grammar Refinement

- Structure Annotation [Johnson '98, Klein&Manning '03]
  - Differentiate constituents based on their local context
- Lexicalization [Collins '99, Charniak '00]
  - Differentiate constituents based on the spanned words
- Constituent splitting [Matsuzaki et al. '05, Petrov et al. '06]
  - Cluster/group words into sub-constituents

### Less independence

```

graph TD
    S --> NP1[NP]
    S --> VP[VP]
    S --> NP2[NP]
    S --> PP[PP]
    NP1 --> PRP[PRP]
    PRP --> I[I]
    VP --> V[V]
    V --> eat[eat]
    NP2 --> N[N]
    N --> sushi[sushi]
    PP --> IN[IN]
    IN --> with[with]
    PP --> N2[N]
    N2 --> tuna[tuna]
    
```

➔

```

S -> NP VP
NP -> PRP
PRP -> I
VP -> V NP
V -> eat
NP -> N PP
N -> sushi
PP -> IN N
IN -> with
N -> tuna
    
```

We're making a strong independence assumption here!

### Markovization

□ Except for the root node, every node in a parse tree has:

- ▣ A **vertical** history/context
- ▣ A **horizontal** history/context

```

graph TD
    S --> NP1[NP]
    S --> VP[VP]
    VP --> VBD[VBD]
    VBD --> heard[heard]
    VBD --> NP2[NP]
    
```

Traditional PCFGs use the full horizontal context and a vertical context of 1

### Vertical Markovization

- Vertical Markov order: rewrites depend on past  $k$  ancestor nodes.
- Order 1 is most common: aka parent annotation

### Allows us to make finer grained distinctions

### Vertical Markovization

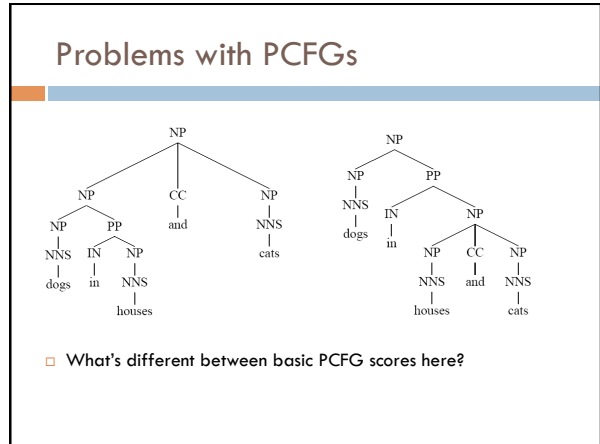

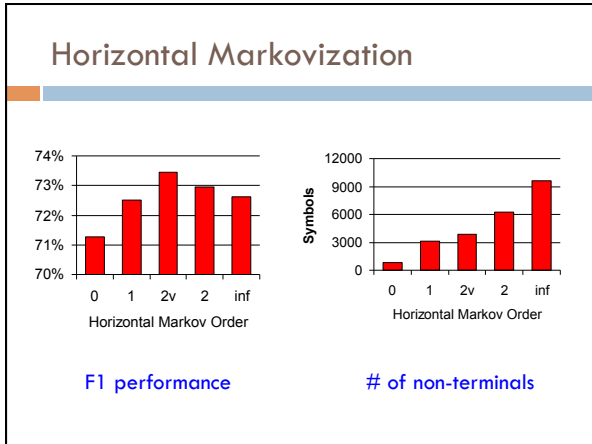

F1 performance

# of non-terminals

### Horizontal Markovization

- Horizontal Markov order: rewrites depend on past  $k$  ancestor nodes
- Order 1 is most common: condition on a single sibling

### Example of Importance of Lexicalization

- A general preference for attaching PPs to NPs rather than VPs can be learned by a vanilla PCFG
- But the desired preference can depend on specific words

The diagram shows a PCFG parser for the sentence "John put the dog in the pen". A list of grammar rules is provided on the left:

S → NP VP	0.9
S → VP	0.1
NP → Det A N	0.5
NP → NP PP	0.3
NP → PropN	0.2
A → ε	0.6
A → Adj A	0.4
PP → Prep NP	1.0
VP → V NP	0.7
VP → VP PP	0.3

The parser outputs a parse tree where the prepositional phrase "in the pen" is attached to the noun phrase "the dog", which is the desired structure.

English 27

### Example of Importance of Lexicalization

- A general preference for attaching PPs to NPs rather than VPs can be learned by a vanilla PCFG
- But the desired preference can depend on specific words

The diagram shows a PCFG parser for the sentence "John put the dog in the pen" with the same list of grammar rules as the previous slide. However, the parser outputs a parse tree where the prepositional phrase "in the pen" is attached to the verb phrase "put the dog", which is not the desired structure. A large 'X' is drawn over the parser box to indicate failure.

English 28

### Lexicalized Trees

How could we lexicalize the grammar/tree?

### Lexicalized Trees

- Add "headwords" to each phrasal node

- Syntactic vs. semantic heads
- Headship not in (most) treebanks

- Usually use head rules, e.g.:

- NP:
  - Take leftmost NP
  - Take rightmost N\*
  - Take rightmost JJ
  - Take right child
- VP:
  - Take leftmost VB\*
  - Take leftmost VP
  - Take left child

### Lexicalized PCFGs?

- Problem: we now have to estimate probabilities like  
 $VP(put) \rightarrow VBD(put) NP(dog) PP(in)$

- How would we estimate the probability of this rule?

$$\frac{\text{Count}(VP(put) \rightarrow VBD(put) NP(dog) PP(in))}{\text{Count}(VP(put))}$$

- Never going to get these automatically off of a treebank
- Ideas?

### One approach

- Combine this with some of the markovization techniques we saw
- Collins' (1999) parser
  - Models productions based on context to the left and the right of the head daughter.
    - $LHS \rightarrow L_n L_{n-1} \dots L_1 H R_1 \dots R_{m-1} R_m$
  - First generate the head (H) and then repeatedly generate left ( $L_i$ ) and right ( $R_i$ ) context symbols until the symbol STOP is generated.

### Sample Production Generation

$VP_{put} \rightarrow VBD_{put} NP_{dog} PP_{in}$

Note: Penn treebank tends to have fairly flat parse trees that produce long productions.

$P_L(STOP | VP_{put}) * P_H(VBD | VP_{put}) * P_R(NP_{dog} | VP_{put}) * P_R(PP_{in} | VP_{put}) * P_R(STOP | PP_{in})$

### Estimating Production Generation Parameters

- Estimate  $P_{Hr}$ ,  $P_{Lr}$ , and  $P_{Rr}$  parameters from treebank data

$$P_R(PP_{in} | VP_{put}) = \frac{\text{Count}(PP_{in} \text{ right of head in a } VP_{put} \text{ production})}{\text{Count}(\text{symbol right of head in a } VP_{put}\text{-}VBD)}$$

$$P_R(NP_{dog} | VP_{put}) = \frac{\text{Count}(NP_{dog} \text{ right of head in a } VP_{put} \text{ production})}{\text{Count}(\text{symbol right of head in a } VP_{put})}$$

- Smooth estimates by combining with simpler models conditioned on just POS tag or no lexical info

$$smP_R(PP_{in} | VP_{put}) = \lambda_1 P_R(PP_{in} | VP_{put}) + (1 - \lambda_1) (\lambda_2 P_R(PP_{in} | VP_{VBD}) + (1 - \lambda_2) P_R(PP_{in} | VP))$$

### Problems with lexicalization

- We've solved the estimation problem
- There's also the issue of performance
- Lexicalization causes the size of the number of grammar rules to explode!
- Our parsing algorithms take too long to finish
- Ideas?

### Pruning during search

- We can no longer keep all possible parses around
- We can no longer guarantee that we actually return the most likely parse
- Beam search [Collins 99]
  - In each cell only keep the  $K$  most likely hypothesis
  - Disregard constituents over certain spans (e.g. punctuation)
  - F1 of 88.6!

## Pruning with a PCFG

- The Charniak parser prunes using a two-pass approach [Charniak 97+]
  - First, parse with the base grammar
  - For each  $X:[i,j]$  calculate  $P(X|i,j,s)$ 
    - This isn't trivial, and there are clever speed ups
  - Second, do the full CKY
    - Skip any  $X:[i,j]$  which had low (say,  $< 0.0001$ ) posterior
  - Avoids almost all work in the second phase!
- F1 of 89.7!

## Tag splitting

- Lexicalization is an extreme case of splitting the tags to allow for better discrimination
- Idea: what if rather than doing it for all words, we just split some of the tags

## Tag Splits

- Problem: Treebank tags are too coarse
  - We even saw this with the variety of tagsets
- Example: Sentential, PP, and other prepositions are all marked IN
- Partial Solution:
  - Subdivide the IN tag

Annotation	F1	Size
Previous	78.3	8.0K
SPLIT-IN	80.3	8.1K

## Other Tag Splits

- UNARY-DT: mark demonstratives as DT^U ("the X" vs. "those")
- UNARY-RB: mark phrasal adverbs as RB^U ("quickly" vs. "very")
- TAG-PA: mark tags with non-canonical parents ("not" is an RB^VP)
- SPLIT-AUX: mark auxiliary verbs with -AUX [cf. Charniak 97]
- SPLIT-CC: separate "but" and "&" from other conjunctions
- SPLIT-%: "%" gets its own tag.

	F1	Size
UNARY-DT	80.4	8.1K
UNARY-RB	80.5	8.1K
TAG-PA	81.2	8.5K
SPLIT-AUX	81.6	9.0K
SPLIT-CC	81.7	9.1K
SPLIT-%	81.8	9.3K

### Learning good splits: Latent Variable Grammars

Parse Tree  $T$   
Sentence  $w$

Derivations  $t : T$

Parameters  $\theta$

Grammar G

- $S_0 \rightarrow NP_0 VP_0 ?$
- $S_0 \rightarrow NP_1 VP_0 ?$
- $S_0 \rightarrow NP_0 VP_1 ?$
- $S_0 \rightarrow NP_1 VP_1 ?$
- $S_1 \rightarrow NP_0 VP_0 ?$
- $S_1 \rightarrow NP_1 VP_1 ?$
- $\dots$
- $NP_0 \rightarrow PRP_0 ?$
- $NP_0 \rightarrow PRP_1 ?$
- $\dots$

Lexicon

- $PRP_0 \rightarrow She ?$
- $PRP_1 \rightarrow She ?$
- $\dots$
- $VBD_0 \rightarrow was ?$
- $VBD_1 \rightarrow was ?$
- $VBD_2 \rightarrow was ?$
- $\dots$

### Refinement of the DT tag

DT

- the (0.50)
- a (0.24)
- The (0.08)

DT-1

- a (0.61)
- the (0.19)
- an (0.11)

DT-2

- The (0.80)
- a (0.01)

DT-3

- this (0.39)
- that (0.28)
- That (0.11)

DT-4

- some (0.20)
- all (0.19)
- those (0.12)

### Learned Splits

- Proper Nouns (NNP):

NNP-14	Oct.	Nov.	Sept.
NNP-12	John	Robert	James
NNP-2	J.	E.	L.
NNP-1	Bush	Noriega	Peters
NNP-15	New	San	Wall
NNP-3	York	Francisco	Street

- Personal pronouns (PRP):

PRP-0	it	He	I
PRP-1	it	he	they
PRP-2	it	them	him

### Learned Splits

- Relative adverbs (RBR):

RBR-0	further	lower	higher
RBR-1	more	less	More
RBR-2	earlier	Earlier	later

- Cardinal Numbers (CD):

CD-7	one	two	Three
CD-4	1989	1990	1988
CD-11	million	billion	trillion
CD-0	1	50	100
CD-3	1	30	31
CD-9	78	58	34

## Final Results

Parser	<i>F1</i>	<i>F1</i>
	<i>≤ 40 words</i>	<i>all words</i>
Klein & Manning '03	86.3	85.7
Matsuzaki et al. '05	86.7	86.1
Collins '99	88.6	88.2
Charniak & Johnson '05	90.1	89.6
<b>Petrov et. al. 06</b>	<b>90.2</b>	<b>89.7</b>

## Article discussion

### □ Smarter Marketing and the Weak Link In Its Success

□ <http://searchenginewatch.com/article/2077536/Smarter-Marketing-and-the-Weak-Link-in-Its-Success>

- What are the ethics involved with tracking user interests for the purpose of advertising? Is this something you find preferable to 'blind' marketing?
- Is possible to get an accurate picture of someone's interests from their web activity? What sources would be good for doing so?
- How do you feel about websites that change content depending on the viewer? What are the implications of sites that behave this way?
