#### Admin

#### Assignment advice

- test individual components of your regex first, then put them all together
- write test cases

Assignment deadlines

**Class** participation

# Assignment 0

What do you think the average, median, min and max were for the "programming proficiency" question (1-10)?

Python	9		
Java	8		
Haskell	1		
Ruby	1		
Matlab	1		
SML	1		
C++	1		

Number of times the word				Number of times the word			
'government'	7	13	18	'innovation'	2	3	9
was used in Obama's State of the Union addresses.	2009	2010	2011	was used in Obama's State of the Union addresses.	2009	2010	2011
Number of Parameters and				Number of times the word			
Number of times the word	-			'win'	1	2	9
'dream'	2	3	12	was used in Obama's State	2000	2040	2014
was used in Obama's State of the Union addresses.	2009	2010	2011	or the Union addresses.	2009	2010	2011
Number of times the word				'Afghan(istan)'	2	5	8

was used in Ohama's State				of the onion addresses.	2008	2010	2011

## Why probability?

Prostitutes Appeal to Pope

Language is ambiguous

Probability theory gives us a tool to model this ambiguity in reasonable ways.

# Basic Probability Theory: terminology

An **experiment** has a set of potential outcomes, e.g., throw a dice, "look at" another sentence

The sample space of an experiment is the set of all possible outcomes, e.g.,  $\{1, 2, 3, 4, 5, 6\}$ 

In NLP our sample spaces tend to be  $\ensuremath{\textit{very}}$  large

- All words, bigrams, 5-grams
- All sentences of length 20 (given a finite vocabulary)
- All sentences
- All parse trees over a given sentence

# Basic Probability Theory: terminology

An **event** is a subset of the sample space

#### Dice rolls

- {2}
- {3, 6}
- even = {2, 4, 6}
- □ odd = {1, 3, 5}

#### NLP

- a particular word/part of speech occurring in a sentence
- a particular topic discussed (politics, sports)
- sentence with a parasitic gap
- pick your favorite phenomena...

#### Events

- We're interested in probabilities of events
  - □ p({2})
  - □ p(even)
  - □ p(odd)
  - p(parasitic gap)
  - p(first word in a sentence is "banana")

Random variables									
We can then talk about the probability of the different values of a random									
rariable									
The definition	of prob	abilitie	es over	all of the	possib	e values	of a ran	dom	
variable aetin	ies a pr	ΙΙασαο	iry aist	ribution					
space	HHH	HHT	HTH	HTT	THH	THT	TTH	TTT	
Х	3	2	2	1	2	1	1	0	
		Y B(Y)							
		$\begin{array}{c} \mathbf{A} \qquad \mathbf{F}(\mathbf{A}) \\ 2 \qquad \mathbf{D}(\mathbf{Y}-2) = 1 \ 0 \end{array}$							
		2	r (	x = 3) = 1	/0				
		2	۲(	x-z) - 3,	/8				
		1	P(	X=1) = 3	/8				
		0	P(	X=0) = 1	/8				

# Unconditional/prior probability

Simplest form of probability distribution is

P(X)

Prior probability: without any additional information:

- What is the probability of heads on a coin toss?
- $\hfill\square$  What is the probability of a sentence containing a pronoun?
- What is the probability of a sentence containing the word "banana"?
- What is the probability of a document discussing politics?...

## Prior probability

What is the probability of getting HHH for three coin tosses, assuming a fair coin?

1/8

What is the probability of getting THT for three coin tosses, assuming a fair coin?

1/8

### Joint distribution We can also talk about probability distributions over multiple variables P(X,Y) probability of X and Y a distribution over the cross product of possible values NLPPass P(NLPPass)

		NLPPass, EngPass	P(NLPPass.
rue	0.89		EngPass)
false	0.11	true, true	.88
F		true, false	.01
Engrass	P(Engrass)	false, true	.04
true	0.92	false, false	.07
false	0.08		

## Joint distribution

- Still a probability distribution
- all values between 0 and 1, inclusive
- all values sum to 1

All questions/probabilities of the two variables can be calculated from the joint distribution

NLPPass, EngPass	P(NLPPass, EngPass)	
rue, true	.88	What is P(ENGPass)?
true, false	.01	
alse, true	.04	
alse, false	.07	

Joint distr	ibution	
Still a probability o all values betwee all values sum to All questions/proba	distribution en 0 and 1, inclusive 1 abilities of the two	variables can be calculated
from the joint distri	bution	
	5011011	0.00
NLPPass, EngPass	P(NLPPass, EngPass)	0.92
NLPPass, EngPass	P(NLPPass, EngPass) .88	0.92 How did you
NLPPass, EngPass true, true true, false	P(NLPPass, EngPass) .88 .01	0.92 How did you figure that out?
NLPPass, EngPass true, true true, false false, true	P(NLPPass, EngPass)           .88           .01           .04	0.92 How did you figure that out?

Joint distri	ibution	
$P(x) = \sum_{y \in Y} p(x)$	(,y)	1
	sum	ining over a variable
NLPPass, EngPass	P(NLPPass, EngPass)	iming over a variable
NLPPass, EngPass	P(NLPPass, EngPass) .88	iming over a variable
NLPPass, EngPass true, true true, false	P(NLPPass, EngPass) .88 .01	iming over a variable
NLPPass, EngPass true, true true, false false, true	P(NLPPass, EngPass)           .88           .01           .04	iming over a variable

# Conditional probability

As we learn more information, we can update our probability distribution

- P(X | Y) models this (read "probability of X given Y")
  - What is the probability of a heads given that both sides of the coin are heads?
  - What is the probability the document is about politics, given that it contains the word "Clinton"?
  - What is the probability of the word "banana" given that the sentence also contains the word "split"?

Notice that it is still a distribution over the values of  $\boldsymbol{X}$ 

A note about notation
When talking about a particular assignment, you should technically write p(X=x), etc.
However, when it's clear, we'll often shorten it
Also, we may also say $P(X)$ or $p(x)$ to generically mean any particular value, i.e. $P(X=x)$
$\frac{P(true, false) = 0.01}{P(Free Pare - false) = 0.01 \pm 0.07 - 0.08} = 0.125$
P(Engrass = jaise) = 0.01 + 0.07 = 0.08

## Chain rule

$$\begin{split} p(X,Y,Z) &= P(X \mid Y,Z) P(Y,Z) \\ p(X,Y,Z) &= P(X,Y \mid Z) P(Z) \\ p(X,Y,Z) &= P(X \mid Y,Z) P(Y \mid Z) P(Z) \\ p(X,Y,Z) &= P(Y,Z \mid X) P(X) \end{split}$$

$$p(X_1, X_2, ..., X_n) = ?$$

Applications of the chain rule  
We saw that we could calculate the individual prior probabilities  
using the joint distribution  
$$p(x) = \sum_{y \in Y} p(x,y)$$
What if we don't have the joint distribution, but do have  
conditional probability information:  
• P(Y)  
• P(X | Y)  
$$p(x) = \sum_{y \in Y} p(y)p(x | y)$$

# Bayes rule Allows us to talk about P(Y | X) rather than P(X | Y)Sometimes this can be more intuitive Why? $p(X | Y) = \frac{P(Y | X)P(X)}{P(Y)}$

# Bayes rule

p(disease | symptoms)

How would you estimate this?

Find a bunch of people with those symptoms and see how many have the disease

Is this feasible?

p(disease | symptoms)  $\propto$  p( symptoms | disease )

How would you estimate this?

Find a bunch of people with the disease and see how many have this set of symptoms. Much easier!

# Bayes rule

- p( linguistic phenomena | features )For all examples that had those features, how many had that
  - phenomena?
  - p(features | linguistic phenomena)
     For all the examples with that phenomena, how many had this feature

p(cause | effect) vs. p(effect | cause)

### Parasitic gaps

http://literalminded.wordpress.com/2009/02/10/ dougs-parasitic-gap/

# Frequency of parasitic gaps

Parasitic gaps occur on average in 1/100,000 sentences

#### Problem:

Laura Linguist has developed a complicated set of regular expressions to try and identify parasitic gaps. If a sentence has a parasitic gap, it correctly identifies it 95% of the time. If it doesn't, it will incorrectly say it does with probability 0.005. Suppose we run it on a sentence and the algorithm says it is a parasitic gap, what is the probability it actually is?

# Prob of parasitic gaps

Laura Linguist has developed a complicated set of regular expressions to try and identify parasitic gaps. If a sentence has a parasitic gap, it correctly identifies it 95% of the time. If it doesn't, it will incorrectly say it does with probability 0.005. Suppose we run it on a sentence and the algorithm says it is a parasitic gap, what is the probability it actually is?

> G = gap T = test positive

What question do we want to ask?

# Prob of parasitic gaps

Laura Linguist has developed a complicated set of regular expressions to try and identify parasitic gaps. If a sentence has a parasitic gap, it correctly identifies it 95% of the time. If it doesn't, it will incorrectly say it does with probability 0.005. Suppose we run it on a sentence and the algorithm says it is a parasitic gap, what is the probability it actually is?

> G = gap T = test positive

p(g | t) = ?
