Basic Probability Theory: terminology

An **experiment** has a set of potential outcomes, e.g., throw a die, "look at" another example

The sample space of an experiment is the set of all possible outcomes, e.g., $\{1,\,2,\,3,\,4,\,5,\,6\}$

For machine learning the sample spaces can be very large

Basic probability theory: terminology

An **event** is a subset of the sample space

Dice rolls

Г

- {2}
- {3, 6}
- even = {2, 4, 6}
- □ odd = {1, 3, 5}

Machine learning

- A particular feature has particular values
- An example, i.e. a particular setting of feature values
- Iabel = Chardonnay

Events

We're interested in probabilities of events

□ p({2})

- p(label=survived)
- p(label=Chardonnay)
- p(parasitic gap)
- p("Pinot" occurred)

Random variables

A random variable is a mapping from the sample space to a number (think events) $% \label{eq:space}$

It represents all the possible values of something we want to measure in an experiment

For example, random variable, X, could be the number of heads for a coin

 space
 HHH
 HHT
 HTH
 HTT
 THH
 THT
 THT
 TTT

 X
 3
 2
 2
 1
 2
 1
 1
 0

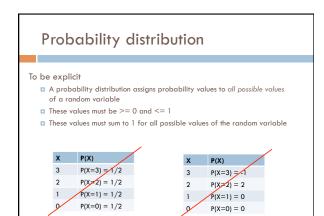

Really for notational convenience, since the event space can sometimes be irregular

Random variables

We're interested in the probability of the different values of a random variable

The definition of probabilities over *all* of the possible values of a random variable defines a **probability distribution**

| space | ннн | HHT | HTH | HTT | THH | THT | ттн | TTT |
|-------|-----|-----|-----|-----------|-----|-----|-----|-----|
| Х | 3 | 2 | 2 | 1 | 2 | 1 | 1 | 0 |
| | | х | P(| (X) | | | | |
| | | 3 | P(| X=3) = 1/ | '8 | | | |
| | | 2 | P(| X=2) = 3/ | '8 | | | |
| | | 1 | P(| X=1) = 3/ | '8 | | | |
| | | 0 | P(| X=0) = 1/ | '8 | | | |

Unconditional/prior probability

Simplest form of probability is P(X)

 $\ensuremath{\mathsf{Prior}}$ probability: without any additional information, what is the probability

- What is the probability of heads?
- What is the probability of surviving the titanic?
 What is the probability of a wine review containing the word "banana"?
- What is the probability of a passenger on the titanic being under 21 years old?

•

Joint distribution

We can also talk about probability distributions over multiple variables

P(X,Y)

- probability of X and Y
- a distribution over the cross product of possible values

| MLPass AND EngPass | P(MLPass, EngPass) |
|--------------------|-----------------------|
| true, true | .88 |
| true, false | .01 |
| false, true | .04 |
| false, false | .07 |

Joint distribution

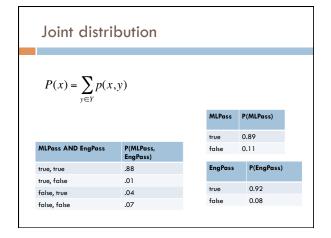

Still a probability distribution

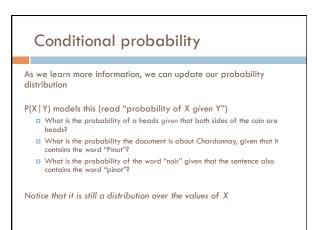

all values between 0 and 1, inclusive all values sum to 1

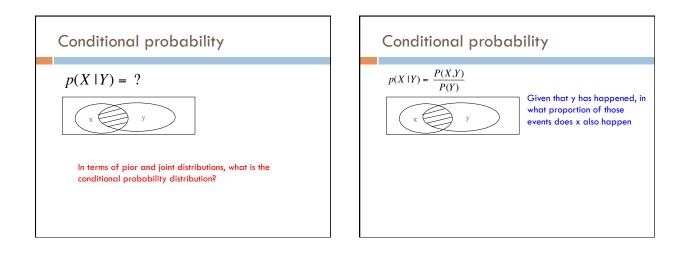

All questions/probabilities of the two variables can be calculate from the joint distribution

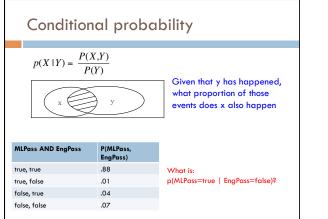

| MLPass AND EngPass | P(MLPass, EngPass) | |
|--------------------|-----------------------|---------------------|
| true, true | .88 | What is P(ENGPass)? |
| true, false | .01 | |
| false, true | .04 | |
| false, false | .07 | |

| | bution | |
|---|---|--------------------------------|
| | | |

| | lities of the two vo | ariables can be calculate from |
| | lities of the two vo P(MLPass, EngPass) | ariables can be calculate from |
| the joint distribution | P(MLPass, | 0.92 |
| the joint distribution | P(MLPass, EngPass) | 0.92 How did you |
| true, true | P(MLPass, EngPass) .88 | 0.92 |

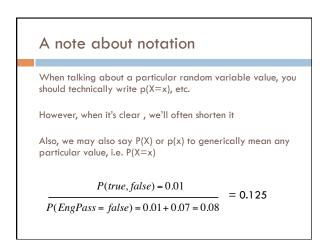

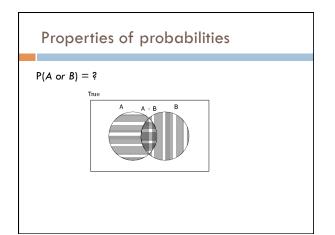

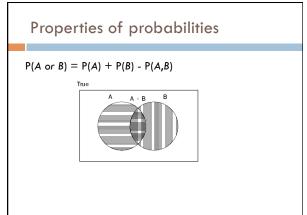

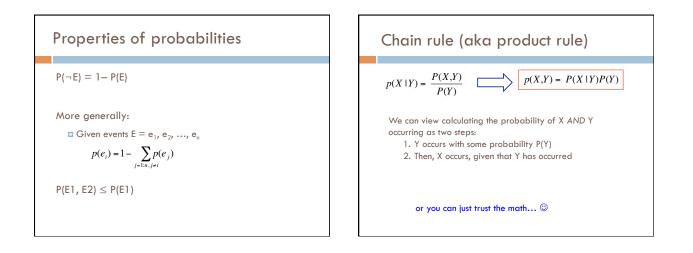

| | | P(X,Y) |
|--------------------|-----------------------|-------------------------------------|
| MLPass AND EngPass | P(MLPass, EngPass) | $p(X \mid Y) = \frac{P(X,Y)}{P(Y)}$ |
| true, true | .88 | What is: |
| true, false | .01 | p(MLPass=true EngPass=false)? |
| false, true | .04 | |
| false, false | .07 | |
| <i>F</i> | e(true, false) = | = 0.125 |

| Both | | |
|---------------------|---------------------|-------------------------|
| Jncondit probabi | ional/prior lity | Conditional probability |
| | | |
| <i>p</i> (| X) | p(X Y) |
| p(MLPass | X) P(MLPass) | MLPass P(MLPass) |
| | | |
| MLPass | P(MLPass) | MLPass P(MLPass) |

Chain rule

$$\begin{split} p(X,Y,Z) &= P(X \mid Y,Z)P(Y,Z) \\ p(X,Y,Z) &= P(X,Y \mid Z)P(Z) \\ p(X,Y,Z) &= P(X \mid Y,Z)P(Y \mid Z)P(Z) \\ p(X,Y,Z) &= P(Y,Z \mid X)P(X) \end{split}$$

$$p(X_1, X_2, ..., X_n) = ?$$

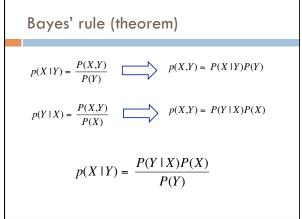

Applications of the chain rule
We saw that we could calculate the individual prior probabilities
using the joint distribution

$$p(x) = \sum_{y \in Y} p(x, y)$$
What if we don't have the joint distribution, but do have
conditional probability information:

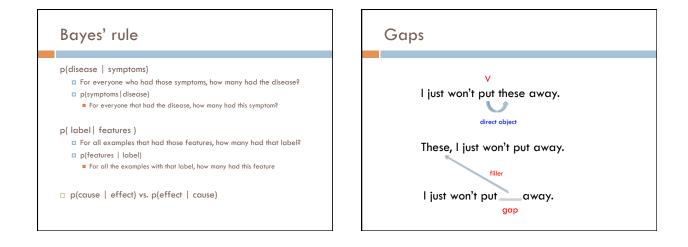

$$P(Y)$$

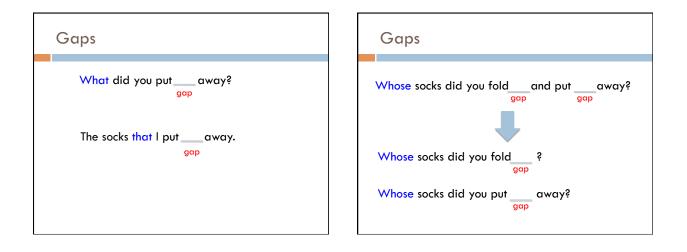

$$P(X | Y)$$

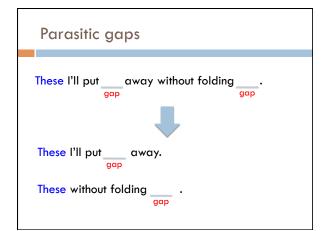

$$p(x) = \sum_{y \in Y} p(y)p(x | y)$$
This is called "summing over" or "marginalizing out" a variable

Bayes' rule
Allows us to talk about
$$P(Y | X)$$
 rather than $P(X | Y)$
Sometimes this can be more intuitive
Why?
 $p(X | Y) = \frac{P(Y | X)P(X)}{P(Y)}$

Parasitic gaps

http://literalminded.wordpress.com/2009/02/10/ dougs-parasitic-gap/

Frequency of parasitic gaps

Parasitic gaps occur on average in 1/100,000 sentences

Problem:

Maggie Louise Gal (aka "ML" Gal) has developed a machine learning approach to identify parasitic gaps. If a sentence has a parasitic gap, it correctly identifies it 95% of the time. If it doesn't, it will incorrectly say it does with probability 0.005. Suppose we run it on a sentence and the algorithm says it is a parasitic gap, what is the probability it actually is?

Prob of parasitic gaps

Maggie Louise Gal (aka "ML" Gal) has developed a machine learning approach to identify parasitic gaps. If a sentence has a parasitic gap, it correctly identifies it 95% of the time. If it doesn't, it will incorrectly say it does with probability 0.005. Suppose we run it on a sentence and the algorithm says it is a parasitic gap, what is the probability it actually is?

> G = gap T = test positive

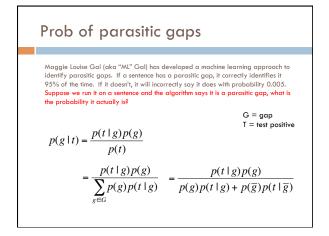

What question do we want to ask?

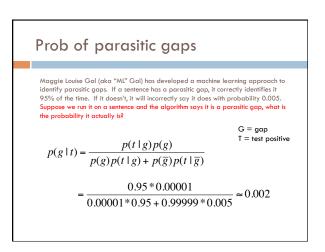

Prob of parasitic gaps

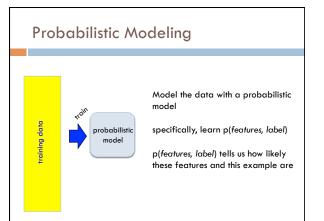

Maggie Louise Gal (aka "ML" Gal) has developed a machine learning approach to identify parasitic gaps. If a sentence has a parasitic gap, it correctly identifies it 95% of the time. If it doesn't, it will incorrectly say it does with probability 0.005. Suppose we run it on a sentence and the algorithm says it is a parasitic gap, what is the probability it actually is?

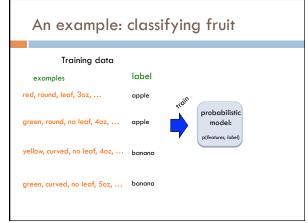

> G = gap T = test positive

 $p(g \mid t) = ?$

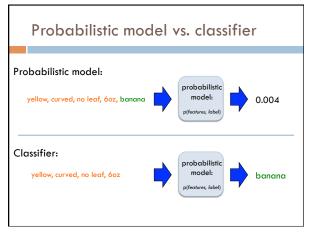

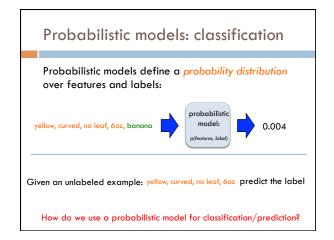

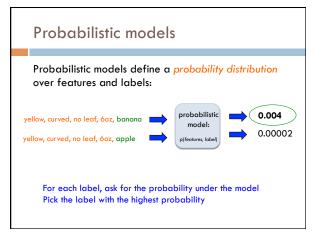

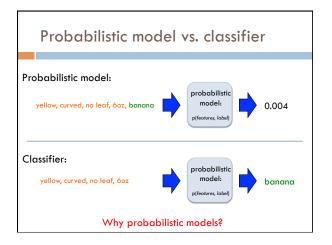

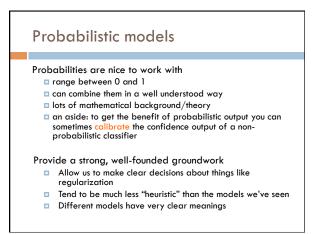

Probabilistic models: big questions

Which model do we use, i.e. how do we calculate p(feature, label)?

How do train the model, i.e. how to we we estimate the probabilities for the model?

How do we deal with overfitting?

Same problems we've been dealing with so far

Probabilistic models

Which model do we use, i.e. how do we calculate p(feature, label)?

How do train the model, i.e. how to we we estimate the probabilities for the model?

How do we deal with overfitting?

ML in general

Which model do we use (decision tree, linear model, non-parametric)

How do train the model?

How do we deal with overfitting?

Basic steps for probabilistic modeling

Step 1: pick a model

Step 2: figure out how to estimate the probabilities for the model

Step 3 (optional): deal with overfitting

Probabilistic models

Which model do we use, i.e. how do we calculate p(feature, label)?

How do train the model, i.e. how to we we estimate the probabilities for the model?

How do we deal with overfitting?

How do train the model, i.e. how to we we estimate the probabilities for the model?

How do we deal with overfitting?

Some maths

 $p(features, label) = p(x_1, x_2, ..., x_m, y)$

 $= p(y)p(x_1, x_2, ..., x_m \mid y)$

What rule?

Some maths

 $p(features, label) = p(x_1, x_2, ..., x_m, y)$

- $= p(y)p(x_1, x_2, ..., x_m | y)$
- $= p(y)p(x_1 | y)p(x_2,...,x_m | y,x_1)$
- $= p(y)p(x_1 | y)p(x_2 | y, x_1)p(x_3, ..., x_m | y, x_1, x_2)$

$$= p(y) \prod_{j=1}^{m} p(x_i \mid y, x_1, \dots, x_{i-1})$$
