

CS 105, Computer Systems Pomona College

C and Assembly Language

September 10, 2019

CS 105, Computer Systems Pomona College

Today

- ▶ Strings and structs, left over from last time
- ▶ Compiling with `gcc`
- ▶ C Language topics
 - ▶ Arrays and pointers
 - ▶ Typedefs
 - ▶ Structs
 - ▶ Memory Management
- ▶ Introduction to X64 Assembly Language

1

CS 105, Computer Systems Pomona College

Strings

- ▶ In C, strings are simply arrays (pointers) of type `char`
- ▶ The end of the string is marked with a `0x00` byte
- ▶ Example: The string "105" is represented by four bytes:
`0x 31 30 35 00`
- ▶ Pitfall: Writing a long string into a small space. You may overwrite other data

2

CS 105, Computer Systems Pomona College

Structs

- ▶ Heterogeneous records, like Java objects
- ▶ Typical linked list declaration:

```
typedef struct cell {
    int value;
    struct cell *next;
} cell_t;
```
- ▶ Usage:

```
cell_t c;
c.value = 42;
c.next = NULL;
```

How many bytes are allocated for `c`? for `p`?
- ▶ Usage with pointers:

```
cell_t *p;
p->value = 42;
p->next = NULL;
```

Find the error →

`p->next` is an abbreviation for `(*p).next`

3

CS 105, Computer Systems Pomona College

gcc, Typical Compilation

From the Data Lab:

```
$ gcc -O -Wall -lm -o btest bits.c btest.c decl.c tests.c
$ ./btest
```

Easier:

```
$ make
$ ./btest
```

4

CS 105, Computer Systems Pomona College

gcc Option Summary

- ▶ Output options
 - ▶ Default is `a.out`
 - ▶ `-o <filename>`, output goes to the named file
 - ▶ `-c`, compile but do not link; output goes to `program.o`
 - ▶ `-S`, assemble only; output goes to `program.s`
- ▶ Optimization options (uppercase "Oh," not zero!)
 - ▶ `-O`, `-O1`, `-O2`, `-O3`, `-Og`
- ▶ Debugging option: `-g`, include symbolic debugging information
- ▶ Warning option example: `-Wall`
- ▶ Library option example: `-lm`, link with the math library

5

CS 105, Computer Systems Pomona College

gcc and File Types

Some files from the Datalab:

| File | Description | Command |
|----------|--------------------|------------------------------------|
| Makefile | | |
| README | | |
| bits.c | Source file | |
| bits.h | Include file | |
| bits.o | Object file | gcc -c bits.c |
| bits.s | Assembly listing | gcc -S bits.c |
| btest | Executable program | gcc -o btest btest.c bits.o decl.o |
| btest.c | | |
| btest.h | | |
| btest.o | | |
| dlc | | |
| ... | | |

6

CS 105, Computer Systems Pomona College

Managing Compilation with make

- ▶ **make** is a command that reads **Makefile**
- ▶ Example extracted from the Datalab **Makefile**:

```
# Makefile that builds btest and other helper programs for the CS:APP data lab
#
CC = gcc
CFLAGS = -O -Wall
LIBS = -lm

all: btest fshow ishow

btest: btest.c bits.c decl.c tests.c btest.h bits.h
    $(CC) $(CFLAGS) $(LIBS) -o btest bits.c btest.c decl.c tests.c

fshow: fshow.c
    $(CC) $(CFLAGS) -o fshow fshow.c
```

- ▶ Actions taken *only* when sources are newer than target
- ▶ **all** is assumed when no target is given on the command line

7

CS 105, Computer Systems Pomona College

Preprocessor Directives

- ▶ **#include <filename>**
- ▶ **#include "filename"**
 - ▶ Usually include header files, with extension `.h`
- ▶ **#define PI 3.14**
- ▶ **#define TIMESFOUR(j) ((j)<<2)**
 - ▶ Textual substitution—parentheses are important!
- ▶ **#if #elif #else #endif**

```
#ifndef _STDIO_H_
#define _STDIO_H_

    All of the code

#endif /* _STDIO_H_ */
```

8

CS 105, Computer Systems Pomona College

Memory Management—Creation

- ▶ **void *malloc(size_t size);**
 - ▶ Allocates a block of (at least) `size` bytes
 - ▶ Returns a pointer to the start of the block
 - ▶ The block exists (on the heap) until it is explicitly recycled
- ▶ Usage:
 - ▶ `cell_t *cp = (cell_t *)malloc(sizeof(cell_t));`
 - ▶ Must cast the result of `malloc`

9

CS 105, Computer Systems Pomona College

Memory Management—Recycling

- ▶ **void free(void *ptr);**
 - ▶ `ptr` must be a value previously returned by `malloc`
 - ▶ Recycles the previously allocated memory block
 - ▶ Error to free twice
 - ▶ “Memory leak” when we forget to free
- ▶ Usage:
 - ▶ `free(cp);`
 - ▶ No need for cast; `void*` is compatible with any pointer type

More on `malloc` and `free` later in the course!

10

CS 105, Computer Systems Pomona College

New Topic: X64 Assembly Language

- ▶ Intel Pentium: 64 bit instruction set
- ▶ Evolutionary design, going back to 8086 in 1978
 - ▶ Basis for original IBM Personal Computer, 16-bits
- ▶ Other languages are translated into X64 instructions and then executed on the CPU
 - ▶ Actual instructions are sequences of bytes
 - ▶ We give them mnemonic names

11

CS 105, Computer Systems Pomona College

Assembly/Machine Code View

Programmer-Visible State

- ▶ PC: Program counter
- ▶ 16 Registers
- ▶ Condition codes

Memory

- ▶ Byte addressable array
- ▶ Code and user data
- ▶ Stack to support procedures

12

CS 105, Computer Systems Pomona College

Assembly/Machine Code View

Repeat forever:

- ▶ Fetch instruction at address in PC
- ▶ Execute the instruction
- ▶ Update PC

13

CS 105, Computer Systems Pomona College

X86-64 Integer Registers

| | | | |
|-------------------|-------------------|-------------------|--------------------|
| <code>%rax</code> | <code>%eax</code> | <code>%r8</code> | <code>%r8d</code> |
| <code>%rbx</code> | <code>%ebx</code> | <code>%r9</code> | <code>%r9d</code> |
| <code>%rcx</code> | <code>%ecx</code> | <code>%r10</code> | <code>%r10d</code> |
| <code>%rdx</code> | <code>%edx</code> | <code>%r11</code> | <code>%r11d</code> |
| <code>%rsi</code> | <code>%esi</code> | <code>%r12</code> | <code>%r12d</code> |
| <code>%rdi</code> | <code>%edi</code> | <code>%r13</code> | <code>%r13d</code> |
| <code>%rsp</code> | <code>%esp</code> | <code>%r14</code> | <code>%r14d</code> |
| <code>%rbp</code> | <code>%ebp</code> | <code>%r15</code> | <code>%r15d</code> |

▶ Can reference low-order 4 bytes (also low-order 1 & 2 bytes)

14

CS 105, Computer Systems Pomona College

X86-64 Register Usage Conventions

| | |
|-------------------------------------|-------------------|
| <code>%rax</code> , function result | <code>%r8</code> |
| <code>%rbx</code> | <code>%r9</code> |
| <code>%rcx</code> , fourth argument | <code>%r10</code> |
| <code>%rdx</code> , third argument | <code>%r11</code> |
| <code>%rsi</code> , second argument | <code>%r12</code> |
| <code>%rdi</code> , first argument | <code>%r13</code> |
| <code>%rsp</code> , stack pointer | <code>%r14</code> |
| <code>%rbp</code> | <code>%r15</code> |

Callee-saved registers are in yellow

15

CS 105, Computer Systems Pomona College

Assembly Characteristics: Data Types

- ▶ "Integer" data of 1, 2, 4, or 8 bytes
 - ▶ Data values
 - ▶ Addresses (untyped pointers)
- ▶ Floating point data of 4, 8, or 10 bytes
- ▶ Code: Byte sequences encoding series of instructions
- ▶ No aggregate types such as arrays or structures
 - ▶ Just contiguously allocated bytes in memory

16

CS 105, Computer Systems Pomona College

Assembly Characteristics: Operations

- ▶ Perform arithmetic function on register or memory data
- ▶ Transfer data between memory and register
 - ▶ Load data from memory into register
 - ▶ Store register data into memory
- ▶ Transfer control
 - ▶ Unconditional jumps to/from procedures
 - ▶ Conditional branches

17

CS 105, Computer Systems Pomona College

Compiling into Assembly

```
long plus(long x, long y);
void sumstore(long x, long y, long *dest) {
    long t = plus(x, y);
    *dest = t;
}
```

```
sumstore:
    pushq   %rbx
    movq    %rdx, %rbx
    call   plus
    movq    %rax, (%rbx)
    popq   %rbx
    ret
```

Obtain assembly listing (on pom-itb-cs2) with command
`gcc -Og -S sum.c`
 Produces the file `sum.s`

May get very different results on different machines!

18

CS 105, Computer Systems Pomona College

Machine Instruction Example

```
*dest = t;
```

```
movq %rax, (%rbx)
```

```
0x40059e: 48 89 03
```

- ▶ C Code
 - ▶ Store value `t` where designated by `dest`
- ▶ Assembly
 - ▶ Move 8-byte value to memory
 - ▶ Quad words in x86-64 parlance
 - ▶ Operands:
 - `t`: Register `%rax`
 - `dest`: Register `%rbx`
 - `*dest`: Memory `M[%rbx]`
- ▶ Object Code
 - ▶ 3-byte instruction
 - ▶ at address `0x40059e`

19

CS 105, Computer Systems Pomona College

Disassembling Object Code

```
000000000400595 <sumstore>:
400595: 53          push  %rbx
400596: 48 89 d3    mov   %rdx,%rbx
400599: e8 f2 ff ff callq 400590 <plus>
40059e: 48 89 03    mov   %rax, (%rbx)
4005a1: 5b        pop   %rbx
4005a2: c3        retq
```

- ▶ Disassembler
 - `$ objdump -d sum`
 - ▶ Useful tool for examining object code
 - ▶ Analyzes bit pattern of series of instructions
 - ▶ Produces approximate rendition of assembly code
 - ▶ Can be run on either `a.out` (complete executable) or `.o` file

20

CS 105, Computer Systems Pomona College

Alternate Disassembly

```
Dump of assembler code for function sumstore:
0x000000000400595 <+0>: push  %rbx
0x000000000400596 <+1>: mov   %rdx,%rbx
0x000000000400599 <+4>: callq 0x400590 <plus>
0x00000000040059e <+9>: mov   %rax, (%rbx)
0x0000000004005a1 <+12>: pop  %rbx
0x0000000004005a2 <+13>: retq
```

- ▶ Using the gdb Debugger
 - `$ gdb sum`
 - `(gdb) disassemble sumstore`
 - `(gdb) x/14xb sumstore`
 - Examine the 14 bytes starting at `sumstore`

21
