

Lecture 21: Synchronization

CS 105

Fall 2023

Review: Problems with Locks

- Problem 1: Correct Synchronization with Locks is Hard
- Problem 2: Locks are Slow
 - threads that fail to acquire a lock on the first attempt must "spin", which wastes CPU cycles
 - replace no-op with yield()
 - threads get scheduled and de-scheduled while the lock is still locked
 - need a better synchronization primitive

Blocking Lock (aka mutex)

- Initial state of lock is 0 ("available")
- acquire(&lock)
 - block (**suspend thread**) until value $n > 0$
 - when $n > 0$, decrement n by one
- release(&lock)
 - increment value n by 1
 - **resume a thread waiting on s (if any)**

```
acquire(&lock) {  
    while(lock->s == 1) {  
        ;  
    }  
    lock->s == 0  
}
```

```
release(&lock) {  
    lock->s == 0  
}
```

Review: Example with Locks

```
/* Global shared variable */
volatile long cnt = 0; /* Counter */
pthread_mutex_t lock =
    PTHREAD_MUTEX_INITIALIZER;

int main(int argc, char **argv){
    long niters;
    pthread_t tid1, tid2;

    niters = atoi(argv[1]);
    pthread_create(&tid1, NULL,
        thread, &niters);
    pthread_create(&tid2, NULL,
        thread, &niters);
    pthread_join(tid1, NULL);
    pthread_join(tid2, NULL);

    /* Check result */
    if (cnt != (2 * niters))
        printf("BOOM! cnt=%ld\n", cnt);
    else
        printf("OK cnt=%ld\n", cnt);
    exit(0);
}
```

```
/* Thread routine */
void* thread(void* vargp){
    long i;
    long niters = *((long*)vargp);

    for (i = 0; i < niters; i++){
        acquire(&lock);
        cnt++;
        release(&lock);
    }

    return NULL;
}
```

Example: Bounded Buffers

finite capacity (e.g. 20 loaves)
implemented as a queue

Threads A: **produce** loaves of bread and put them in the queue

Threads B: **consume** loaves by taking them off the queue

Example: Bounded Buffers

finite capacity (e.g. 20 loaves)
implemented as a queue

Separation of concerns:

1. How do you implement a bounded buffer?
2. How do you synchronize concurrent access to a bounded buffer?

Threads A: **produce** loaves of bread and put them in the queue

Threads B: **consume** loaves by taking them off the queue

Example: Bounded Buffers

Values wrap around!!

```
typedef struct {
    int* b;           // ptr to buffer containing the queue
    int n;           // length of array (max # slots)
    int count;       // number of elements in array
    int front;       // index of first element, 0 <= front < n
    int rear;        // (index of last elem)+1 % n, 0 <= rear < n
} bbuf_t
```

```
void init(bbuf_t* ptr, int n){
    ptr->b = malloc(n*sizeof(int));
    ptr->n = n;
    ptr->count = 0;
    ptr->front = 0;
    ptr->rear = 0;
}
```

```
void put(bbuf_t* ptr, int val){
    ptr->b[ptr->rear]= val;
    ptr->rear= ((ptr->rear)+1)%(ptr->n);
    ptr->count++;
}
```

```
int get(bbuf_t* ptr){
    int val= ptr->b[ptr->front];
    ptr->front= ((ptr->front)+1)%(ptr->n);
    ptr->count--;
}
```

Exercise 1: What can go wrong?

Example: Bounded Buffers

0 1 2 3 4 5 (n=6)

b	3	2			4	1
---	---	---	--	--	---	---

```
typedef struct {  
    int* b;          rear  
    int n;  
    int count;  
    int front;  
    int rear;  
    pthread_mutex_t lock;  
};
```

```
} bbuf_t  
void init(bbuf_t* ptr)  
{  
    ptr->b = malloc(n * sizeof(int));  
    ptr->n = n;  
    ptr->count = 0;  
    ptr->front = 0;  
    ptr->rear = 0;  
    init(&(ptr->lock));  
}
```

```
void put(bbuf_t* ptr, int val){  
    acquire(&(ptr->lock))  
    while(ptr->count == ptr->n){  
        release(&(ptr->lock))  
        acquire(&(ptr->lock))  
    }  
    ptr->b[ptr->rear] = val;  
    ptr->rear = ((ptr->rear)+1)%(ptr->n);  
    ptr->count++;  
    release(&(ptr->lock))  
}
```

```
int get(bbuf_t* ptr){  
    acquire(&(ptr->lock))  
    while(ptr->count == 0){  
        release(&(ptr->lock))  
        acquire(&(ptr->lock))  
    }  
    int val = ptr->b[ptr->front];  
    ptr->front = ((ptr->front)+1)%(ptr->n);  
    ptr->count--;  
    release(&(ptr->lock))  
    return val;  
}
```

Condition Variables

- A condition variable `cv` is a stateless synchronization primitive that is used in combination with locks (mutexes)
 - condition variables allow threads to efficiently wait for a change to the shared state protected by the lock
 - a condition variable is comprised of a waitlist
- Interface:
 - **`wait(CV* cv, Lock* lock)`**: Atomically releases the lock, suspends execution of the calling thread, and places that thread on `cv`'s waitlist; after the thread is awoken, it re-acquires the lock before `wait` returns
 - **`signal(CV* cv)`**: takes one thread off of `cv`'s waitlist and marks it as eligible to run. (No-op if waitlist is empty.)

Example: Bounded Buffers

0 1 2 3 4 5 (n=6)

```
typedef struct {
    int* b;
    int n;
    int count;
    int front;
    int rear;
    pthread_mutex_t lock;
    CV bread_bought;
    CV bread_added;
} bbuf_t
```

↑
rear

↑
front

```
void init(bbuf_t* ptr, int n){
    ptr->b = malloc(n*sizeof(int));
    ptr->n = n;
    ptr->count = 0;
    ptr->front = 0;
    ptr->rear = 0;
    init(&(ptr->lock));
    init(&(ptr->bread_bought));
    init(&(ptr->bread_added));
}
```

```
void put(bbuf_t* ptr, int val){
    acquire(&(ptr->lock))
    while(ptr->count == ptr->n)
        wait(&(ptr->bread_bought))
    ptr->b[ptr->rear]= val;
    ptr->rear= ((ptr->rear)+1)%(ptr->n);
    ptr->count++;
    signal(&(ptr->bread_added))
} release(&(ptr->lock))
```

```
int get(bbuf_t* ptr){
    acquire(&(ptr->lock))
    while(ptr->count == 0)
        wait(&(ptr->bread_added))
    int val= ptr->b[ptr->front];
    ptr->front= ((ptr->front)+1)%(ptr->n);
    ptr->count--;
    signal(&(ptr->bread_bought))
    release(&(ptr->lock))
    return val;
}
```

Using Condition Variables

1. Declare a lock. Each shared value needs a lock to enforce mutually exclusive access to the shared value.
2. Add code to acquire and release the lock. All code access the shared value must hold the objects lock.
3. Identify and declare condition variables. A good rule of thumb is to add a condition variable for each situation in a function must wait for.
4. Add loops are your waits. Threads might not be scheduled immediately after they are eligible to run. Even if a condition was true when signal/broadcast was called, it might not be true when a thread resumes execution.

Exercise: Synchronization Barrier

- With data parallel programming, a computation proceeds in parallel, with each thread operating on a different section of the data. Once all threads have completed, they can safely use each others results.

What can go wrong?

```
int done_count = 0;  
Lock lock;  
CV all_done;
```

```
/* Thread routine */  
void *thread(void *args)  
{  
    parallel_computation(args)  
  
    done_count++;  
  
  
  
    use_results();  
  
}
```

Condition Variables

- A condition variable `cv` is a stateless synchronization primitive that is used in combination with locks (mutexes)
 - condition variables allow threads to efficiently wait for a change to the shared state protected by the lock
 - a condition variable is comprised of a waitlist
- Interface:
 - **`wait(CV * cv, Lock * lock)`**: Atomically releases the lock, suspends execution of the calling thread, and places that thread on `cv`'s waitlist; after the thread is awoken, it re-acquires the lock before `wait` returns
 - **`signal(CV * cv)`**: takes one thread off of `cv`'s waitlist and marks it as eligible to run. (No-op if waitlist is empty.)
 - **`broadcast(CV * cv)`**: takes all threads off `cv`'s waitlist and marks them as eligible to run. (No-op if waitlist is empty.)

Exercise: Readers/Writers

- Consider a collection of concurrent threads that have access to a shared object
- Some threads are readers, some threads are writers
 - a unlimited number of readers can access the object at same time
 - a writer must have exclusive access to the object

```
int num_readers = 0;  
int num_writers = 0;
```

```
int reader(void *shared){  
  
    num_readers++;  
  
    int x = read(shared);  
  
    num_readers--;  
  
    return x  
}
```

```
void writer(void *shared, int val){  
  
    num_writers=1;  
  
    write(shared, val);  
  
    num_writers=0;  
}
```

Programming with CVs

C

- Initialization:

```
pthread_mutex_t lock =  
    PTHREAD_MUTEX_INITIALIZER;  
pthread_cond_t cv =  
    PTHREAD_COND_INITIALIZER;
```

- Lock acquire/release:

```
pthread_mutex_lock(&lock);  
pthread_mutex_unlock(&lock);
```

- CV operations:

```
pthread_cond_wait(&cv, &lock);  
pthread_cond_signal(&cv);  
pthread_cond_broadcast(&cv);
```

Python

- Initialization:

```
lock = Lock()  
cv = Condition(lock)
```

- Lock acquire/release:

```
lock.acquire()  
lock.release()
```

- V

```
cv.wait()  
cv.notify()  
cv.notify_all()
```
