

# Lecture 20: Audit

---

CS 181S

November 26, 2018

# Classes of Countermeasures

- **Authentication:** mechanisms that bind principals to actions
- **Authorization:** mechanisms that govern whether actions are permitted
- **Audit:** mechanisms that record and review actions

# Uses of audit

- **Deterrence through accountability:** deter misbehavior

The image displays three IRS tax forms. On the left is Form 1040, 'U.S. Individual Income Tax Return' for 2017, showing a taxpayer with a W-2 from 'The Big Company' and a total income of \$48,500.00. In the center is Form 1041, 'Resident Income Tax Return' for 2017, showing a trust with a total income of \$6,835.00. On the right is Form 1515, 'Miscellaneous Income' for 2017, which is mostly blank.

- **Detection and recovery:** determine what happened and how to recover

The screenshot shows the IRS Direct Pay website with a red banner announcing a 'Planned Outage: April 17, 2018 - December 31, 9999'. Below the banner, a message states: 'This service is unavailable from approximately 2:50 A.M. ET, on Tuesday April 17, 2018 until approximately 6:40 P.M. ET, on Thursday September 22, 2016, due to planned maintenance. Please come back after that time, or you can visit [Make a Payment](#) for alternative payment methods. We apologize for any inconvenience. Note that your tax payment is due although IRS Direct Pay may not be available.'

Data Center ▶ **Servers**  
It's US Tax Day, so of course the IRS's servers have taken a swan dive  
59% of our systems are obsolete, agency boss tells congressional hearing

By [Thomas Claburn in San Francisco](#) 17 Apr 20

***I.R.S. Website Crashes on Tax Day as Millions Tried to File Returns***  
By ALAN RAPPEPORT APRIL 17, 2018

At the bottom of the article snippet are social media icons for Facebook, Twitter, Email, and a share icon, along with a bookmark icon.

- **Problem monitoring:** real-time intelligence

# Audit tasks

- **Recording:**

- what to log
- what not to log
- how to log
  - locally
  - remotely
- how to protect the log

- **Reviewing:**

- automated analysis
- manual exploration

# WHAT TO LOG

---

# What to log?

## **Example:** US State Department pilot program (1980s)

- Requirements:
  - log every transaction related to protected electronic documents
  - system administrator reviews log daily to search for malicious behavior
- Experiment:
  - test system for 5 users, 10 minutes
  - audit log was a stack of paper
  - real system would have been 1000s of users working 24/7
- Lessons learned:
  - logging and review of everything by a human is impractical
  - need to reduce information logged: **log reduction**
  - need automated review

# States vs. events

- **States:** data, *what the system is*
  - backup, or more
  - survive power failures, crashes, attacks
  - **what state?** memory, disk, network, ...
  - consistent snapshot of distributed system is hard
- **Events:** actions, *how the system came to be*
  - login, access to protected resource, elevation and attenuation of privileges, ...
  - our focus
  - **which events?**

# Recall: Security requirements

- **Functional requirement:** something system should do
  - e.g., allow people to cash checks
- **Security goal:** something system should/shouldn't do
  - e.g., prevent loss of revenue through bad checks
- **Security requirement:** constraint on functional requirement to achieve goal
  - e.g., check must be drawn on bank where being cashed, or person cashing must be customer at that bank and deposit in their account

# Events to log

- **Any event that involves a security requirement**
  - Fact that requirement was checked
  - Whether it was met or not
  - The information that led to that decision
- Typically involves the gold standard...
  - whether a **principal was authenticated**, or
  - whether an **action was authorized**

# Orange Book logging

For minimal C2 level certification:

- **Events** to log:
  - Use of identification and **authentication** mechanisms
  - **Introduction of objects** into a user's address space (e.g., file open, program initiation)
  - **Deletion of objects**
  - Actions taken by computer **operators** and system **administrators** and/or system **security officers**

# Orange Book logging

For minimal C2 level certification:

- **What** to log:
  - Date and time of the event
  - User
  - Type of event
  - Success or failure of the event
  - For identification/authentication events: origin of request
  - For events involving objects: name of the object

# What not to log

- Some information might be too sensitive for log files:
  - plaintext keys, passwords
  - the details of company's shiny new product
  - the GPS coordinates of undercover secret agents

## macOS High Sierra Logs Encryption Passwords in Plaintext for APFS External Drives

By [Catalin Cimpanu](#)

- Possibilities:
  - log it anyway, protect the log
  - [sanitize](#) log

# Sanitization

Protect confidential information in log

- by **deleting**
- by **modifying**
  - e.g., replace with user names with pseudonyms, keep separate protected map between names and pseudonyms

# Sanitization

- **Before** writing to log:
  - **Pro:** protects users from system administrators; maybe surveillance warranted only with probable cause
  - **Con:** have to decide in advance, as part of system design, what information to keep vs. discard
- **After** writing to log:
  - **Con:** confidentiality of log must be (more) protected
  - **Pro:** can decide afterwards what information to discard, perhaps even redact logs and send to 3<sup>rd</sup> party for analysis

# Examples: CMS and Sakai

# Example: CMS

Details logged:

- Event type
- Acting NetID
- Acting IP address
- Affected NetIDs
- Simulated NetID
- Assignment, if any
- Event details (no sanitization of grades)

# HOW TO LOG

---

# Say what you mean

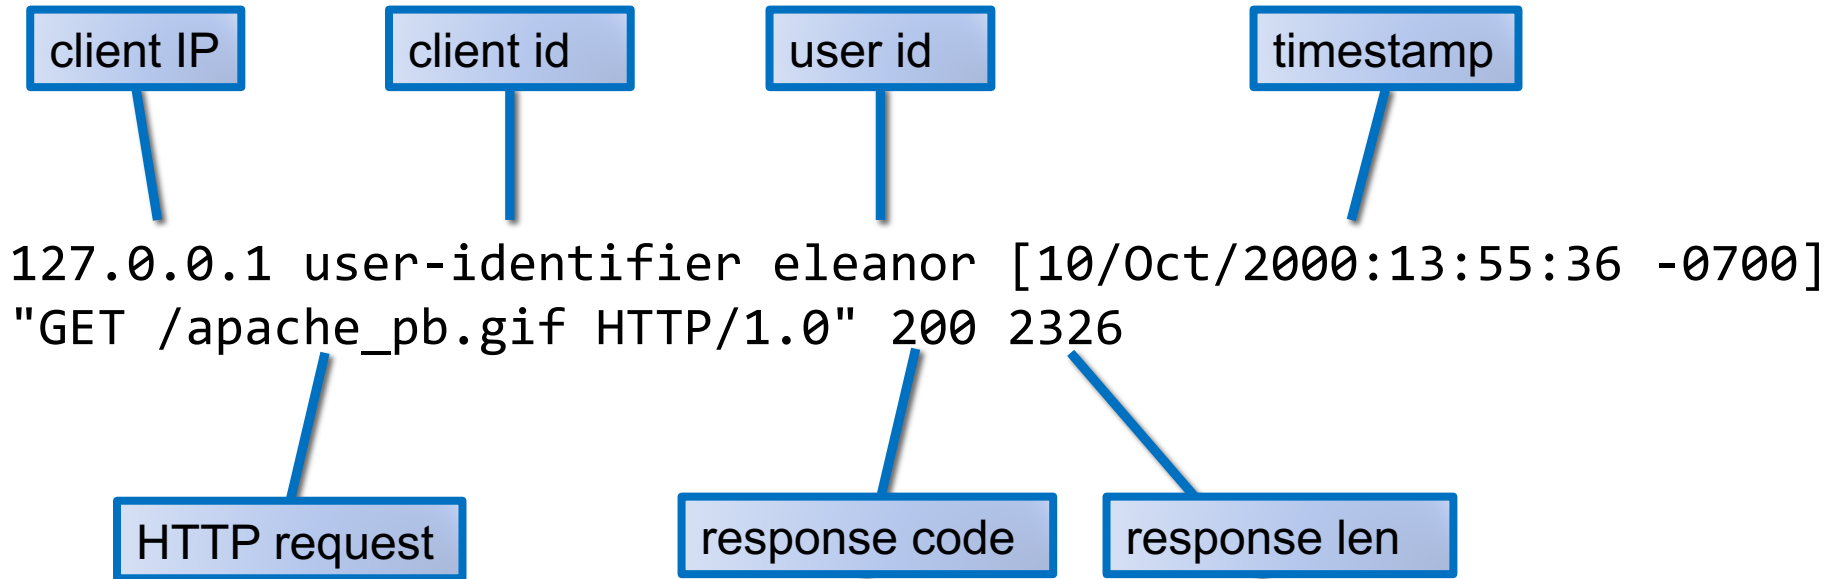

**Main principle:** Every log entry should say what it means

- Interpretation of log entry should depend only upon content of log entry
- Hence reviewer can recover meaning without needing to assume or supply any context

# Log file format

- Keeping log files in standard format enables...
  - Reuse of tools for log analysis
  - Correlation across logs from multiple applications
- Standard formats:
  - Common Log Format (used by web servers)
  - syslog (used by Unix)
    - originated with sendmail
    - became a *de facto* standard
    - then standardized by IETF: [RFC 5424](#)
    - examples: take a look in your local /var/log directory

# Common Log Format

# syslog example message

timestamp

hostname

application

process id

AppleThunderboltNHIType2::prePCIWake - power up  
complete - took 1624 us

message

# Log space

What happens if log size grows too large?

- **Halt** system
- **Overwrite** previous entries
- **Stop** logging

# SECURING THE LOG

---

# Approaches to Securing Audit Log

- Limit access to log files
- Transmit entries to remote audit server
- Use cryptography

# Limit Access to Log files

- least privilege
- limit who can read
- limit how principals can write (append-only for most users)

# Remote Audit Servers

- how often?
- how secure log entries en route?

# syslog architecture

- **Originators:** source of messages
  - might duplicate to multiple relays
- **Relays:** forward messages
  - might filter or duplicate messages
- **Collectors:** sink of messages
  - might collect from many sources

# syslog architecture

# Security concerns with syslog

Base syslog protocol has no security goals

- Recommended to [use SSL to protect communication channel](#)
- Nonetheless, receivers are permitted to truncate or drop messages
- Even with SSL, [end-to-end integrity](#) of messages from originator to collector not guaranteed
  - Concerns include provenance, message integrity, replays, sequencing, detection of missing messages
  - Digital signatures provide solution [[RFC 5848](#)]

# Securing the log with crypto

- **Threat:** Attacker who compromises host that stores log. Attacker can read/write log file and can access secret keys
- **Harm:** log can be read, modified, deleted
- **Vulnerability:** log protected only by access control mechanisms on host (prior to archiving on remote server)

# Securing the log with crypto

- **System:**

- machine M maintains a local log
- periodically M synchs log to trusted remote log server S
- might be very long periods between synch: if short periods are possible, no real need for this protocol

- **Goals:** assume attacker compromises M at time t...

- Contents of log **messages entered before t are not disclosed** to anyone who can read log at M (Confidentiality)
- Contents of log **messages and their sequence before time t cannot be changed** in a way that is undetectable by S (Integrity)

- **Countermeasure:** cryptography: use **iterated hashing:**  
 $H(H(H(\dots H(v)\dots)))$  to create tamper-resistant log

# Audit tasks

- **Recording:**
  - what to log
  - what not to log
  - how to protect the log
- **Reviewing:**
  - manual exploration
  - automated analysis

# REVIEWING THE LOG

---

# Manual review

- Enable administrators to explore logs and look for {states, events}
- **Issues:**
  - Designers might not have anticipated the right {states, events} to record
  - Visualization, query, expressivity (HCI/DB issues)
  - Correlation amongst multiple logs

# Interfaces

- **Flat text** [example: last time's syslog]
- **Hypertext**
- **DBMS** [example: queries in CMS]
- **Visualization tools**

# Techniques

- **Temporal replay:** animate what happened when
- **Slice:** display minimal set of log events that affect a given object

# Automated review and response

- **Review:** detect suspicious behavior that looks like an attack, or detect violations of explicit policy
  - Custom-built systems
  - Classic AI techniques like training neural nets, expert systems, etc.
  - Modern applications of machine learning
- **Response:** report, take action
