

Lecture 15: Nested Lists

CS 51P

October 30, 2019

Lists

- a list is an ordered set of elements:

```
[3, 6, 2, 1]
```

- many ways to create a list including:

```
a_list = [3, 6, 2, 1]
b_list = []
c_list = "a b c d".split()
d_list = open("temp.txt", "r").readlines()
```

- a list is a sequence, so can index into, loop over, check for membership, slice, etc
- operators: + and *
- lists are mutable

adding to a list

- `a_list.extend(list)`
- `a_list.append(elem)`
- `a_list.insert(index, elem)`

other

- `min(a_list)`, `max(a_list)`,
`len(a_list)`
- `elem in a_list`
 - returns bool
- `a_list.index(elem)`
 - returns int or error

removing from a list

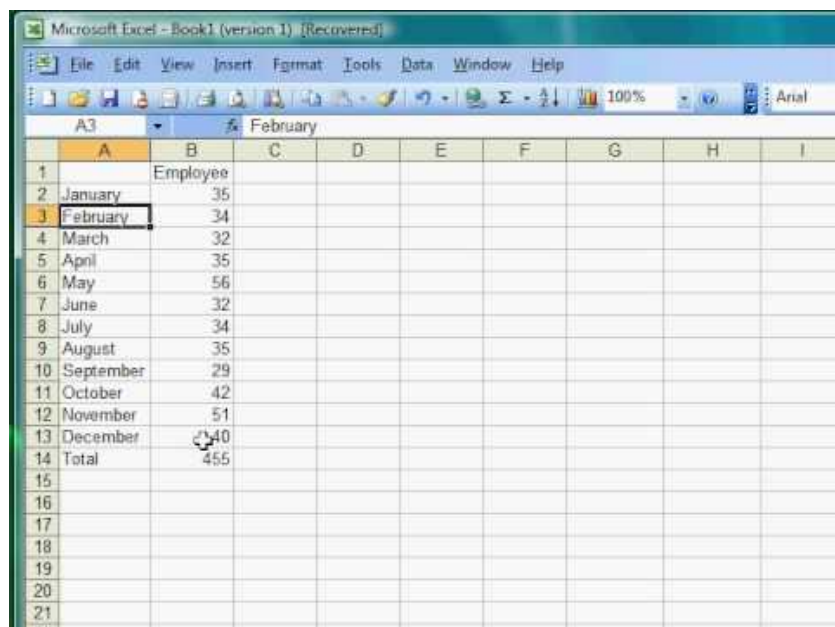

- `del(a_list[slice])`
- `a_list.remove(elem)`
 - error if *elem* not in `a_list`
- `a_list.pop()`
 - returns (and removes) `a_list[-1]`
- `a_list.pop(index)`
 - returns (and removes) `a_list[index]`

modifying a list

- direct assignment

Matrices

- Can think of lists as a one-dimensional matrix
- What if you want to use a two-dimensional matrix?
- Can create a **list of lists** aka a **nested list**!

Microsoft Excel - Book1 (version 1) [Recovered]

20									
21									

Example

```
a_list = [ [4, [True, False], 6, 8], [888, 999] ]

if alist[0][1][0]:
    print(alist[1][0])
else:
    print(alist[1][1])
```

Example

- Define a function `nested_total` that takes a list of lists of ints and returns the sum of all the values.

```
list = [[1,2], [3], [4,5,6]]  
sum = nested_total(list)  
print(sum)
```

Exercise

- Define a function `nested_avg` that takes a list of lists of ints and returns a list with each sublist averaged

```
list = [[1,2], [3], [4,5,6]]  
list_avg = nested_avg(list)  
print(list_avg)
```

```
[1.5, 3.0, 5.0]
```

Example

LEVEL: Beginner

		9	6		7	4	3	1
8				5	3			9
	6		2			5		
		8	9					6
		2		4		7		5
					1			
			5	9	4	3		2
	2	7		3				1
4			1		2	6	5	

www.dctech.com/sudoku/

```
board = [[0,0,9,6,0,7,4,3,1],  
         [8,0,0,0,5,3,0,0,9],  
         [0,6,0,2,0,0,5,0,0],  
         ...  
         [4,0,0,1,0,2,6,5,0]]
```

- write a function `set_value` that takes a nested list `board` and ints `i`, `j`, `n` and updates the `(i,j)`th entry of `board` to be the value `n`
- write a function `check_row_i` that takes an int `i` and a nested list `board`. The function should return `True` if and only if row `i` contains each integer from 1 through 9 exactly once.

Exercise

LEVEL: Beginner

		9	6		7	4	3	1
8				5	3			9
	6		2			5		
		8	9					6
		2		4		7		5
					1			
			5	9	4	3		2
	2	7		3				1
4			1		2	6	5	

www.dctech.com/sudoku/

```
board = [[0,0,9,6,0,7,4,3,1],
          [8,0,0,0,5,3,0,0,9],
          [0,6,0,2,0,0,5,0,0],
          ...
          [4,0,0,1,0,2,6,5,0]]
```

- write a function `check_column_i` that takes an int `i` and a nested list `board`. The function should return `True` if and only if column `i` contains each integer from 1 through 9 exactly once.
- write a function `check_block_ij` that takes ints `i` and `j` and a nested list `board`. The function should return `True` if and only if the 3x3 block starting at row `i`, column `j` contains each integer from 1 through 9 exactly once
- write a function `check_solution` that takes a nested list `board` and returns `True` if and only if `board` represents a correctly solved puzzle
