The emergence of blogs and other types of user generated content has transformed the Web from a collection of professionally produced sites to include vast compilations of personal thoughts, experiences, opinions, and feelings. The program in Network Arts is focused on creating informative and compelling performance installations that find, use and expose interesting pieces of user generated content from the Web. This talk will introduce you to the concept of Network Arts through two systems. The first system, Buzz, finds and exposes the most emotional stories from the millions of blogs on the Web using a variety of retrieval and filtering strategies. The stories are then brought to life by a cast of virtual actors using speech synthesis in a digital theater installation. The second system, News at Seven, is an automatically generated news show presented through a realistic modern gaming engine, complete with anchors in a virtual set, interviews with the public, and background images and videos.
